FROM the description given by Dr. Coppinger of the "confervoid alga" observed on board H.M.S *Alert* some 200 miles to the southward of Tongatabu (NATURE, vol. xxiii. p. 482), the conferva in question would appear to be of a species similar to that from which the Red Sea is said to obtain its name. Whilst proceeding up the Red Sea in H.M.S. *Hornet* during the month of June of last year, I had many opportunities of observing the dirty-reddish scum on its surface—a phenomenon which must be familiar to all navigators of this sea. Each of the little bundles composing it measured about $\frac{1}{16}$th of an inch in length and $\frac{1}{150}$th in breadth, and contained from twenty to fifty filaments, each filament being composed of a linear series of short cells, and measuring $\frac{1}{2000}$th of an inch in breadth. I did not observe the discoid bodies referred to by Dr. Coppinger, but their absence may be explained by assigning to this conferva a particular season for the production of these bodies. Scattered among the bundles were tiny spherical bodies possessing a bristly appearance, which proved to be formed of a confused network of the filaments that composed the bundles.

This conferva would appear to have a very wide distribution. It was observed by Mr. Darwin near the Abrolhos Islets which lie off the east coast of South America; and it is with regard to this phenomenon that the author of the "Journal of the *Beagle*" thus writes:—"Mr. Berkeley informs me that they are the same species (*Trichodesmium erythræum*) with that found over large spaces in the Red Sea, and whence its name of Red Sea is derived. In almost every long voyage some account is given of these confervæ. They appear especially common in the sea near Australia; and off Cape Leeuwin I found an allied but smaller and apparently different species. Capt. Cook in his third voyage remarks that the sailors gave to this appearance the name of sea-sawdust." H. B. GUPPY

The Banks of the Yang-tse at Hankow

AT the end of January, 1878, when the waters of the Yang-tse occupied their lowest level, I had the opportunity of examining the left bank of the river immediately below the foreign settlement. The bank, which varied from thirty to thirty-five feet in height, did not present a single perpendicular face, but was cut up into two or more terraces formed by the lingering of the waters at those levels for some extent of time. A calcareous loam, homogeneous in appearance and dark in colour, composed the entire bank with the exception of the upper portion, where a layer of sand a few inches in thickness seperated two layers of laminated loam, each of them of similar thickness. After a little trouble I was enabled to observe that the apparently homogeneous loam was made up of fine horizontal layers varying from one-thirtieth to one-tenth of an inch in thickness; but the lamination was often concealed; and it was only where the loam had been freshly broken away that the layers were sufficiently distinct to be counted. Shells were embedded in the loam, but mostly in the lower half of the bank; those of the genus "Paludina" were the most abundant, whilst bivalves of the genus "Corbicula" occurred, but not in any numbers. The upper three feet of the river-bank were riddled with the burrows of annelids, and these burrows were often filled with little rounded masses of loam, evidently the excrementitious droppings of the worms.

If, as in the case of the alluvial valley of the Nile, it be considered that each of the fine layers which compose the bank of the Yang-tse was deposited during the periodic annual inundation of the river, then every layer will represent a year's deposit; and taking the average thickness of each layer to be one-twentieth of an inch, it would require twenty years to form an inch and a century to form five inches; whilst the whole thickness as exposed in the river-bank would require for its formation a period of between 7000 and 8000 years.[1]

---

[1] The borings and excavations round the pedestal of the statue of Rameses at Memphis enabled Mr. Horner to estimate the rate of deposition of the alluvium of the Nile at 3½ inches in a century. (*Vide* Lyell's "Principles of Geology.")

It may be pertinent to the subject of this paper to remark on the general appearance of the region around Hankow. A vast alluvial plain extends to the horizon in all directions; whilst dotted over its surface are several shallow lakes, which are lost in the general flood of waters when the Yang-tse overflows its banks in the summer months. Rising abruptly out of this alluvial formation are a few isolated groups of low hills, which in the time of flood stand out like islands from the surrounding waste of waters.

It would be interesting to ascertain whether the banks of the Yang-tse possess this lamination whenever the river winds its way through an alluvial plain. I noticed the same appearance in the low banks of the estuary near the village of Wusung; the horizontal layers varying in this instance from one-tenth to one-fourteenth of an inch in thickness. Shells of both fresh-water and salt-water genera—"Paludina" and "Mactra"—were embedded in the bank.

An Experiment on Inherited Memory

WHEN I was a boy I had an electrical machine and Leyden jar; there was also a dog in the family. As a matter of course I "electrified" the dog, and ever afterwards during the remainder of his natural life he ran away in extreme terror when a bottle was presented to him.

The recollection of this has recently suggested an experiment that may be made by some of the readers of NATURE. By means of a small Leyden jar moderately charged startle *both the father and the mother* of an intended forthcoming generation of puppies. When these are full grown and away from their parents observe whether they are at all disturbed by the sight of a bottle or a Leyden jar, care being taken that the bottle is never shown to the parents in the presence of the offspring.

A single experiment will not be sufficient. It should be tried by several; for which reason I suggest it here. There is no more cruelty involved than in an ordinary practical joke. It is not the pain of the shock, but its startling mystery that frightens the animal, especially if the shock is given by placing the jar on a piece of tinfoil or sheet metal, and allowing the dog spontaneously to investigate by smelling the knob of the jar while his fore-feet are in communication with the outer coating. Under ordinary circumstances the dog obtains through his nose much information concerning the properties of things before he actually touches them, but in this case his whole life experience is contradicted by the mysterious, inodorous, diabolical vitality of the vitreous fiend. A bottle thenceforth makes upon the intellect of the dog a similar impression to that which a sheeted broomstick in a churchyard makes upon the similar intellect of a superstitious rustic.

Stonebridge Park, Willesden

Meteors

THREE very bright meteors were observed here during the month of December, 1880, and are, I think, worthy of record.

1. December 2, 1h. 14m. 50s. a.m. A meteor brighter than Jupiter descended towards the west point of the horizon, passing about 1° N. of Saturn, and somewhat farther from Jupiter, and in a line therefore nearly parallel to that joining those two planets. The train was visible about three seconds.

2. December 8, 10h. 55m. 30s. p.m. A meteor as bright as Jupiter descended towards the north point of the horizon, about 1° below η Ursæ Majoris, its path being inclined at an angle of about 35° to the horizon. The train was brilliant, but vanished speedily.

3. December 24, 10h. 4m. p.m. A very bright meteor, seen through (or below) the clouds in the south-south-east, shot down towards the south-south-west point of the horizon, at an angle of about 30°. No stars were visible in that part of the heavens at the time.

Classification of the Indo-Chinese and Oceanic Races

IN your issue of December 20 (p. 199), just to hand (February 12), I notice a contribution by Mr. A. H. Keane on the classification of the Indo-Chinese and Oceanic races.

As the *Orang Semang* of the Malay Peninsula is only just referred to, I conclude that the author has not seen Maclay's papers on the wild tribes of the Malayan Peninsula in the second number of the *Journal* of the Straits Branch of the Royal Asiatic Society and a memoir by the same writer in the *Journal of Eastern Asia*, of which unfortunately only one number appeared. On the Jakuns, Maclay, who has probably seen more of their inner life and habits than any other ethnologist, writes as follows of the *Semang* and *Lakai* tribes:—"Logan" (*Journal of the Indian Archipelago*, vol. vii. p. 31, 32), "though differing from some others, says that the *Orang Semang* are certainly *Negritos*, but he calls them a mixed race. According to my experience I must declare this also to be incorrect.

"From my own experience and observations I have come to the conclusion that the *Orang Lakai* and the *Orang Semang* are tribes of the same stock, that further, in their physical *habitus* and in respect of language they are closely connected with each other, and represent a pure unmixed branch of the Melanesian race; anthropologically therefore they absolutely differ from the Malays. The Melanesian tribes of the Malay Peninsula, chiefly because of the form of their skull, which has a tendency to be brachycephalic, approach the *Negritos* of the Philippines, and, like the latter, they do not differ very widely from the Papuan tribes of New Guinea."

In the fifth number of the *Journal* of the Straits Branch of the R.A.S., Mr. Swettenham, the Assistant Colonial Secretary for the Native States S.S., thus describes the *Semangs* of Ijoh:—

"These people are short in stature, dark in colour, and their hair is close and woolly like that of negroes, with this difference, that all the men wear four or five short tufts or corkscrews of hair growing on the back of their heads, called *jambul*."

During my botanical excursion through Perak in 1877 I had two *Semangs* as guides, answering to Mr. Swettenham's description.

The Straits Branch of the R.A.S. is as yet in its infancy, having been established only in 1877, and its *Journal* has probably not yet secured a very wide circulation, although the five numbers that have been published contain probably more authentic information about the Malayan Peninsula than can be found elsewhere.

The characters Mr. Keane has employed to indicate the word "papûwah" are certainly not Malayan; at any rate it would be a matter of impossibility to secure the services of a Malay in Singapore who would be capable of deciphering them. The word, which is a corruption of the Malayan or Javanese adjective *puwah-puwah*, is usually spelt thus— ڤوڤوه

Writing about New Guinea, Crawfurd ("A Descriptive Dictionary of the Indian Islands," p. 300) thus expresses himself about the word Papua:—"Some recent geographers have thought proper to give the great island the name of Papua, but an innovation which is correct neither in sound, sense nor orthography seems to possess no advantage over one which it has borne now for nearly three centuries and a half."

It may not be out of place here to remark that Messrs. Trübner and Co. are the London agents of the Straits R.A.S.

Singapore S.S., February 12

H. J. MURTON

Fascination

IN the interior of the province Valdivia, South Chili, a species of wood-snipe (*Paipayen inc.*) is often caught by the natives in the following manner:—When the bird flies into one of the low bushes, which in spots of about three to six metres diameter are found frequently in the wood-meadows there, two men on horseback go round it in the same direction, swinging their lazos over the bush. After ten or more rounds one man slips down from his horse, whilst the other continues, leading his companion's horse behind. Carefully then the first man creeps on to the point, where the paipayen is sitting nearly motionless or stupefied with the rider's circular movements, and kills it by a quick blow of a stick.

When I first was told so I would not believe it; but in 1853 or 1854 I took part myself in this kind of capture in the hacienda San Juan, in Valdivia, belonging to my chief, Dr. Philippi, now professor in the University and director of the museum in Santiago. I had left the house without gun, accompanied by a native servant, when, in a part of the wood called Quemas, I observed a paipayen falling into a dense but low bush of the above-mentioned kind. Desiring to obtain a good specimen of this not very common bird for our collection, I expressed my regret at not having the gun, but the servant replied: "Never mind, if you wish, we will get the bird." And he caught it with my assistance in the above way without injuring it.

Marburg, March 16 CARL OCHSENIUS

Flying-Fish

JUNE 11, 1873, at sea 300 miles south of Panama, I saw a man-of-war hawk and a school of bonitos in pursuit of a school of flying-fish. As one of the latter came out of the water, closely pursued by his enemy, the hawk swooped down, not fifty yards from the ship, but missed his prey, the fish *apparently* turning from its course to avoid him. A second attempt was more successful, and the hawk flew off with the flying-fish in his talons. The whole affair was plainly seen, as also was the continued chase of the flying-fish by the bonitos.

THE OXFORD COMMISSIONERS ON PROFESSORS

WE are not disposed to agree with the outcry which has been raised in some quarters in reference to the proposition of the Oxford University Commissioners to enact certain regulations with the view of compelling Oxford Professors to reside in the University and to give lectures.

Some of the Commissioners' regulations relating to this subject appear to many to be ill-advised, but they have been improved by the recent modifications, and the general intention seems not only a right one, but also one which must be carried out whenever public opinion is brought to bear on the matter.

A very simple view of the matter may be suggested. The professors in the English Universities might be put on the same footing as are the professors in German Universities. In those Universities the professors carry on abundant research; they also give very numerous lectures, usually what may be called "representative courses," that is, courses in which an attempt is made to present to the student the main outlines and much of the detail of the subject professed. Even in the Collège de France at Paris, which is *not* (strictly speaking) an educational institution, each professor is required to give an annual course of lectures (to the number of forty, we believe).

Research and the advancement of learning are, we do not for a moment doubt, the highest, and therefore in a certain sense the first business of University professors. It is perhaps because this is so generally admitted that the Commissioners did not at first insist upon it. But it is in order that he may teach—not huge popular audiences nor cram-classes, but devoted thoroughgoing students—that the professor creates new knowledge. His best result is not new knowledge itself, but new youthful investigators ready and able to carry on the researches which he has commenced, and through which they have learnt method and gained enthusiasm. There is no stimulus to research so healthy and so sure as that afforded by the opportunity of converting a class of generous-minded young men into ardent disciples and loving fellow-workers.

Hence, it may be maintained, there is no necessary antagonism between *true professorial teaching* (*i.e.* definite courses of lectures) and the profoundest study and research.

That the Commissioners have introduced no binding regulations with the object of forcing a professor to carry on research, is, we believe, a proof of wisdom and a just tribute to the dignity of such work. No regulations can make an investigator: the question as to whether a given professorship will be used for the advancement of science and learning is decided before any regulations can have effect, viz., when the choice of a person to fill the post is made. If he is a "searcher" already, he will remain so; if he is not, a bad choice will have been made, and no regulations as to research can ever amend it. It is, however, well that the Commissioners have seen fit to improve their first set of regulations in so far as to state that an Oxford professor is *expected* to advance the study of the subject to which his chair is assigned.

The measures which the Commissioners propose for insuring the delivery of lectures by Oxford professors are objectionable on the ground that they are purely penal. They should be persuasive. The German professor is only too glad to give a thorough and attractive course of lectures if he has it in him to do so, because he thereby doubles or trebles the income which he derives from endowment. The Oxford Commissioners have made a great mistake in prohibiting the professors from charging fees for the compulsory course of two or three lectures a week. All students, whether belonging to the professor's own college or not, should be liable to pay fees to the professors for attendance on their courses of instruction, whether lectures or laboratorial. It is only by so arranging the position and endowment of a professor that he is both able and willing to increase his income by the fees paid by his class, that a really firm and satisfactory basis for the regulation of a professor's duties can be obtained.

It has been maintained that where an income derived from an endowment of 600*l*. can be increased to 1000*l*. a year by the receipts from lecture-fees, the professor will be anxious to give such lectures as will attract students—and in spite of objections ready to hand, it is held that those are the lectures which should be given. It is not true that a professor so circumstanced will necessarily degenerate into a mere examination coach. If he should be tempted to do so the fault lies with the examination. The professor should himself have a voice in the arrangement of the examination, and care should be taken by the University that it is so organised and defined in all its parts that students who have carefully followed a high class of professorial teaching, such as would be offered by a Huxley, a Ludwig, a Bunsen, or a Fischer, should come to the front in it rather than those who have crammed with some newly-fledged classman, or with an experienced "coach" versed in all the artifices of sham knowledge.

It appears to be an excellent and necessary provision to which it is to be hoped that the Commissioners will adhere in spite of all opposition, that the professors in each faculty should with other University teachers in the same faculty constitute a council having the power of controlling to some extent the lectures of each individual professor. There is no degradation in this; it is the almost universal custom in existing Universities. The faculty has to provide for the teaching of its proper studies, and naturally must exercise a friendly control over the extent and scope of the courses of instruction offered by its members.

It is owing to the absence of any such control at the present moment that even by those Oxford professors who do lecture, no representative course on *any subject* is ever given. A student in Oxford cannot by any possibility attend a thorough *course* of lectures or laboratory instruction in physiology, nor in zoology, nor in botany, nor in physics, nor in chemistry. And yet in the smallest as well as the largest of the often despised "medical schools" of London, a student has provided for him courses of from thirty to a hundred lectures every year in all these subjects, as well as in others, to be attended, of course, in successive sessions. The same absence of complete or representative courses of instruction is to be noted at Oxford in other departments, such as philology, archæology, various departments of history, &c.

The sole cause of the existence of such complete courses in other institutions than Oxford—over and above the primary one connected with the income from fees—is that the professor has to submit his scheme of lectures for the ensuing session or year in a general way to his colleagues, who would suggest to him a more complete or more representative program, were his proposals considered insufficient, and might take steps to supplement his teaching by the appointment of a supplementary professor (thus diminishing the original professor's income from fees), were he to prove intractable.

The keystone of the professorial system, on which all such control and persuasion, co-operation and reciprocal criticism, must rest, is the income from class-fees. In having not only not insisted upon this, but in having actually prohibited the free levying of fees, the Oxford Commissioners have made their scheme for professors absolutely unworkable. They have simply played into the hands of those who have at present a most injurious monopoly of the fees paid by students, and who give in return as little and as inadequate teaching as they please, namely, the confederacy of boarding-house keepers known as "college tutors and lecturers."

The proposal that professors should examine their classes and report to the Heads of Colleges as to the performance of each student was characterised by a spirit of petty interference quite unworthy of the large objects placed before the Commissioners, and has very properly been withdrawn. Such details, together with some other points, might well have been left by the Commissioners to the Councils of Faculties, which they so wisely intend to bring into existence.

It may be urged that if the Commissioners were to confine themselves in these and similar matters to creating the organisation which is terribly needed at Oxford, and of which these Councils of Faculties promise to be the most powerful and important part, they might with very great advantage leave the question of terminal examinations, and the scale of fees to be charged for lectures, &c., to be worked out by the reorganised University itself. But instead of prohibiting class-fees they should have strengthened the hands of the professoriate in the competition with the powerful band who are interested in maintaining the disastrous and absurd system of college tuition and tuition-fees. So long as the undergraduate is forced to pay to college tutors a lump sum of 25*l.* a year, he will seek his instruction (whether he finds it or not) from those whom he has been compelled to pay, and not from the professors whom he is not allowed to pay.

It is clear that with the present body of free-holders it was necessary for the Commissioners to insist on the new principle that a professor is not to be free from responsibility (*Lehrfreiheit*, we may observe, does *not* mean "freedom *from* teaching," as some writers who in the daily papers have recently appealed to German precedents almost seem to fancy), but is, on the contrary, to be charged with certain duties and to be responsible in a measure to his brother professors for performing those duties in a satisfactory manner.

ACADEMICUS

THE INTERNATIONAL GEOLOGICAL CONGRESS

THIS Congress is to hold its second session at Bologna, commencing on September 29, 1881, under the presidency of Signor Q. Sella, president of the Accademia dei Lincei of Rome, and under the patronage of His Majesty the King of Italy, who has liberally placed the necessary funds at the disposal of the Italian Committee of Organisation, of which Prof. J. Capellini of the Bologna Museum is the president, and General Tarannelli of the University of Pavia the secretary.

The movement sprang out of a suggestion made at a meeting of the American Association of Science held at Buffalo, New York, August 25, 1876, that an International Geological Congress was advisable, to insure uniformity of methods of representing geological phenomena, and the value of terms. Towards this end a committee of organisation was formed, of which Prof. James Hall was president and Dr. Sterry Hunt secretary, in which England was represented by Prof. Huxley, and Sweden by Dr. Otto Torell. The result of their deliberations was the first session of the Congress held at Paris, in the Palace of the Trocadéro, under the presidency of Prof. Hébert and the patronage of the Minister of Public Instruction. At the Congress, which lasted six days, two International Commissions were appointed, the one to consider geological cartography, with a view of adopting a common system of signs and colours, the other to investigate the possibility of effecting the unification of geological nomenclature and to consider all matters relating to stratigraphical classification and nomenclature, to a certain extent involving an inquiry into the value and significance of petrological and palæontological characters. A third Commission, entirely French, was also appointed to report on Bologna, on the rules to be followed in establishing the nomenclature of species in mineralogy and palæontology.

M. Renevier, general secretary of the first Commission, has just published his second report of progress, and states that advantage was taken of the presence of several members of the Commission during the fiftieth anniversary meeting of the Geological Society of France on April 2, 1880, to hold a meeting of the Commission at which five European countries were represented, under the presidency of M. Daubrée; since then, more or less detailed reports from nearly all the committees representing different countries have been received, except from Canada, presided over by Mr. Selwyn, and Great Britain by Prof. Ramsay. In some of these schemes there is a considerable amount of agreement. Quaternary deposits being represented by a pale green, Pliocene by pale yellow, Miocene dark yellow or orange, Eocene by bistre, Cretaceous by green, Jurassic by blue, Lias by violet, Trias by burnt sienna, Permian and Carboniferous by dark grey, Devonian by brown, or brown stripes on pink, Crystalline schists by rose carmine, Granite by dark carmine, divisions in the various rocks being expressed by tints of the same colour, or by shading or dotting.

The General Secretary of the Commission for the Unification of Nomenclature is M. Devalque, who reports that this Commission also met at the Paris Geological Society's anniversary, France being represented by M. Hébert, Switzerland by Prof. A. Favre, and Great Britain by Prof. Hughes. The latter Commissioner, aided by Prof. Prestwich, has now succeeded in organising a British sub-Commission, who have appointed six committees to inquire into groups of formations, and (1) to draw up a list of the names now in use; (2) to ascertain the true significance of such names or terms, giving reference to the authors by whom they were used in the first instance, or subsequently with a modified meaning; (3) to investigate into the synonomy of such names and terms in the first place as regards the British Isles, and afterwards to inquire into their correlation with them in use in other areas; and (4) to offer suggestions for the unification of the nomenclature. As the committees can seldom sit, as their members are scattered, they have been modelled on the principle of the Inquiry Committees of the British Association, and have attached to them one or two "reporters," charged with assimilating the views and facts collected by the Committee. The reporters for the British Isles, are for Recent and Tertiary rocks, Messrs. Starkie Gardner and H. B. Woodward; for Cretaceous rocks Messrs. Topley and Jukes-Browne; for Jurassic rocks Messrs. Huddlestone and Blake; for Trias and Permian, Mr. De Rance and the Rev. A. Irving; for

Carboniferous, Devonian, and Old Red, Messrs. Morton and Strahan; for Silurian, Cambrian, and Pre-Cambrian, Messrs. Lapworth and Marr. For chemical, dynamical geology, petrology, and mineral veins Messrs. Bauerman and T. Davies.

The last-mentioned committee is specially to consider the question of nomenclature under the following general heads: (1) Terms founded on physical characters; (2) founded on mineral composition; (3) founded on names of places; (4) founded on local peculiarities and common usage; (5) founded on theories of origin and other hypotheses; (6) synonyms; (7) suggestions for systematising and for unification of nomenclature.

The Sub-commission or General Committee has Prof. Hughes for its chairman, and Mr. E. B. Tawney for its secretary; its duty is to receive the reports of the Committees and to consider the value of terms. The list of names forming the Sub-Commission includes those of Mr. Etheridge, P.G.S., Professors Bonney, Boyd Dawkins, Haughton, Hull, Judd, Lebour, Morris, Prestwich, Rupert Jones, and Seeley; Doctors Clement Le Neve Foster, Evans, Geikie, J. Geikie, Hicks, Nicholson, and Sorby, and the names already mentioned, of members acting as Reporters, Secretary, and the Chairman. The Sub-Commission consider that the word *system* should be used as the term indicating the largest sub-division, applied to a group which stands by itself, easily and clearly distinguishable from the rocks above and the rocks below, bounded above and below by triads in stratigraphical regions, and characterised by special forms of life. *Formation* expresses a smaller group, with some lithological and palæontological characters in common, but which may be in continuous sequence with the rocks above and below. *Deposit* implies similarity of lithological character. *Layers, laminæ, bed, group, series,* and *rock* are still under discussion. *Zone* and *horizon* were defined; but *cycle* and *data* were left open questions.

Through the liberality of His Majesty the King of Italy, the committee of organisation are able to offer a prize of 5000 francs for the best suggestion for an international scale of colours and conventional signs practically applicable to geological maps and sections, including those of small scale. The index of colours and signs should be accompanied by maps representing regions of varied geological structure, and by an explanatory memoir in the French language. The documents should be marked with a motto, which should be placed on the outside of an envelope containing the name of the author, which will not be opened until the Congress, when the name of the successful competitor will be made known. The index and accompanying papers should be sent in to Prof. J. Capellini, director of the Museum at Bologna, by the end of May. The award will be made by a jury of five chosen from the presidents of sub-commissions. Should no index be thought worthy of the grand prize, the best will receive a gold medal of the value of 1000 francs, while to the two next will be given medals of silver and bronze of similar shape. C. E. DE RANCE

THE FALLS OF NIAGARA IN WINTER

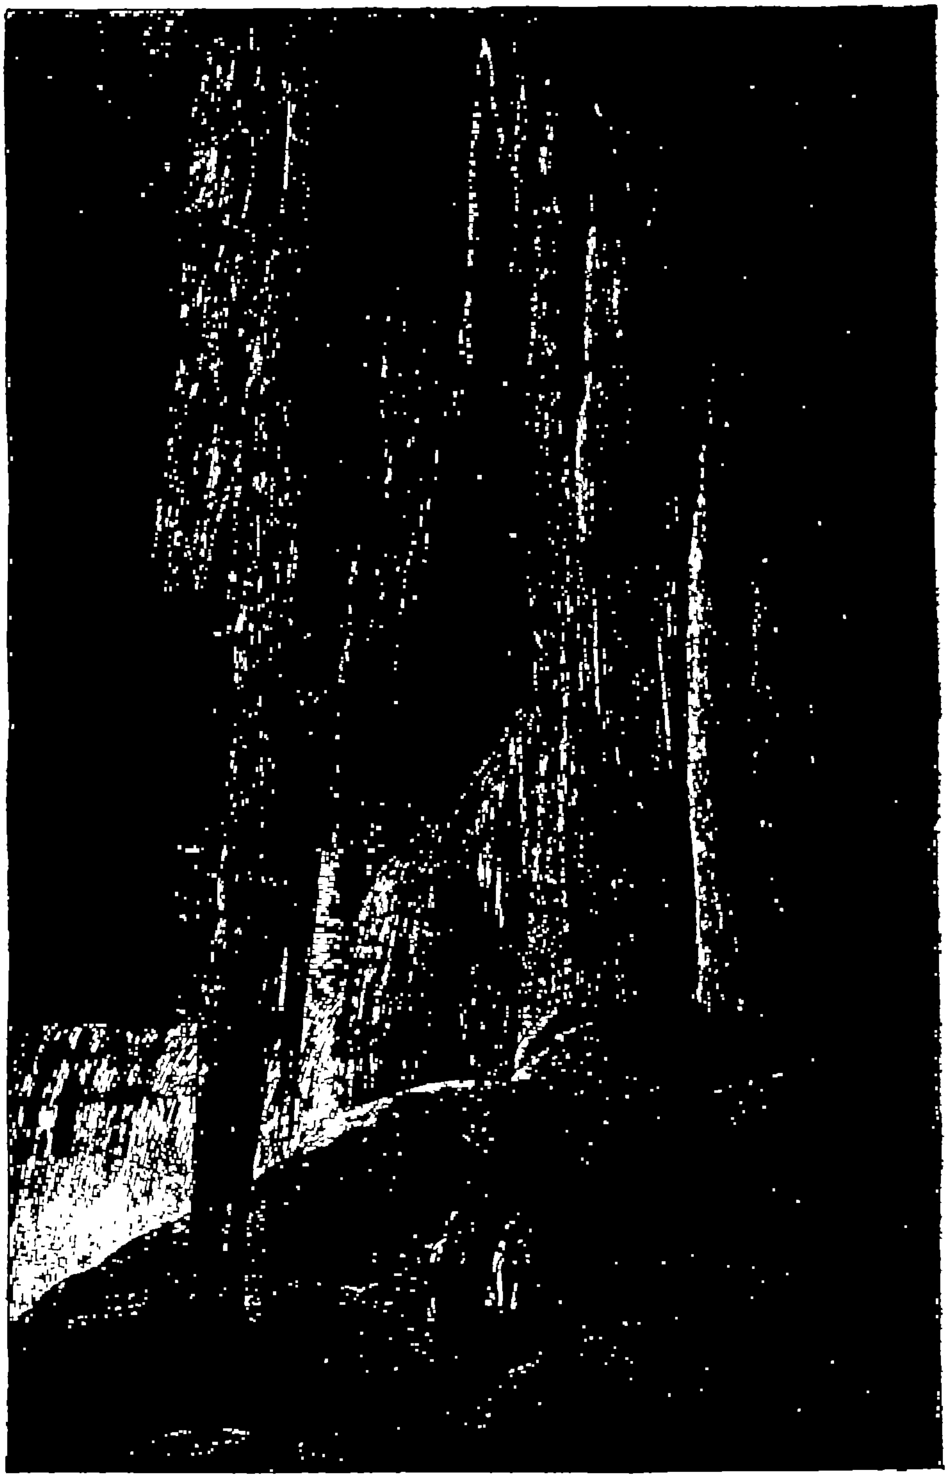
In the first week of last February it fell to my lot to make very hurriedly the transcontinental journey of 3500 miles from San Francisco to New York. Before starting I resolved that the one stoppage which I could allow myself *en route* should be made at Niagara. I had visited the Falls in the early summer of 1879, and was so profoundly impressed by them that I could not resist the opportunity of seeing them again under their wintry aspect; and I was confirmed in my resolve by seeing statements in various American papers to the effect that, owing to the long-continued and exceptionally severe cold of the present winter, the Ice-mountains at the Falls were higher than had ever been previously known. These statements were confirmed to me on the spot by several persons long resident in the village.

Two or three preliminary notes on the journey across the Rocky Mountains in midwinter may not be without interest for the readers of NATURE. I left San Francisco on February 2nd in the midst of most serious floods, and on that particular day they attained their maximum, which was one inch higher than any previously recorded. It was estimated that 3500 square miles of the most fertile land of California was under water, and in many parts steamboats of light draught were plying over the country. Any assessment of damage would have to be made by millions of dollars. I heard many and grievous complaints of the damage done to the agricultural interests of the country by the "hydraulic mining," which washed the hillsides down into the river beds, filling them up, and thus prevented much flood-water from being carried off. In some places the railroad track had been apparently washed away, for it could not be found, and from this cause our journey to Sacramento was lengthened about fifty miles, as the gigantic ferry-boat *Solano* could not be used for the short route. This boat has four tracks upon it, and will carry twenty-four cars. As each car seats fifty people, this is equal to carrying a train that will accommodate 1200 people. It has four side-wheels, each with its engine and set of boilers. In crossing the Sierras we encountered little snow, but a great deal of rain. The greatest amount of snow on the journey was in the upper part of the Weber Cañon, 100 miles east of Ogden and Salt Lake. Here there had been considerable difficulty in keeping the line open during January, but the train-service had not been interrupted for a single day, although the snow-sheds and snow-ploughs were constantly required. That the weather had been unusually severe was shown by the very large number of dead cattle along the line, from Ogden across the Laramie plains, and also, I was informed, in Colorado. In the four days between San Francisco and Omaha (where we arrived punctually), the terminus of the Pacific Railroad, the temperature was never below 26° F., and the air so still that I frequently saw smoke-rings from the locomotive funnel expand to 6 or even 8 feet diameter, rising perhaps 30 or 40 feet in doing so. All the cars were warmed, usually to too great an extent, from 70° to 75° F., being the normal temperature for the interior of railway cars, hotels, private houses, and schools, as far as my experience went.

East of the Missouri (which, like all the rivers I crossed, was frozen over) trains were everywhere very much delayed, owing to snowstorms, or to the slippery state of the rails, which were coated with ice. The utmost caution was used by those in charge of trains, and a strong impression was left on my mind that safety, and not speed or punctuality, was the primary consideration in such American railway management as I came across.

On leaving Chicago a phenomenon presented itself which is common enough in America, though but rarely seen in this country, and never on so gigantic a scale. For several days the temperature had been very low, and every object was exceedingly cold. On the night of February 6th, the air-temperature rose to 33° F., and fine rain fell. This froze upon everything and encased it with transparent ice, from which in many instances delicate icicles depended. Sad havoc was played with the overhead telegraph wires in Chicago itself (which were broken by the weight); but on leaving the city in the early morning the exceeding beauty of the whole country, usually so uninteresting from its flatness, became apparent. A light coating of snow lay on the ground, but everything, every twig, every dead leaf, every blade of grass, had its own transparent covering, which in the occasional gleams of the sun shone with the most gorgeous colours.

For seven or eight hours we travelled through this, a distance of some 250 miles, and I heard of similar and simultaneous appearances over larger tracts of country.



Gigantic icicle under Table Rock, photographed in January, 1881. The upper right-hand corner is rock, and a portion of the Canadian (or Horse-Shoe) Fall is seen on the left. The whole of the apparent ground is a mass of frozen spray which has accumulated many feet in thickness on the shingle, &c., at the foot of the rock.

Probably the most wonderful exhibition ever seen, of, not frozen rain, but frozen spray, was to be found at the Falls of Niagara. A large number of readers of NATURE have visited them, and possibly all are sufficiently familiar with their topography, through the medium of books and photographs, to render any general description unnecessary. I will therefore confine myself to the special features produced by this winter's cold.

The whole district lay under a thin coating of snow, and all the roads were in good condition for sleighing; indeed those near the Falls were so completely ice-covered with frozen spray, as to render no other mode of locomotion possible. Those who have seen both places have probably been struck, as I was, with the strong resemblance between the gorge of the Niagara river below the Falls, and the gorge of the Avon at Clifton, Bristol. The latter is the finer of the two, being narrower, and having higher sides, but both are limestone gorges, and similar in character. In the Niagara gorge numerous springs discharge themselves into the chasm at various points in the precipitous rocky sides, and at these points numerous collections of huge and massive icicles appeared as though adherent to the rock, measuring perhaps seventy or eighty feet in length, and eight to ten feet in irregular diameter. In the exquisite purity of their colour and general appearance, they reminded me strongly of the pillars of ice in the upper part of the Rhone glacier.

The width of the river itself was not a little lessened, both in the rapids above and the comparatively still water below the Falls, by the ice at the banks, and it was a matter of surprise to notice how much ice accumulated at the edges of water that was running very rapidly. At the top of the American Fall itself there were so many accumulations of ice that the Fall was actually divided into five separate and distinct Falls, in the same way as, even in summer, that portion of the Fall which is in front of the "Cave of the Winds" is cut off by rocks on the upper edge, from the main body of the Fall.

The mention of the "Cave of the Winds" recalls also that huge boulder, the "Rock of Ages," in front of this portion of the Fall. That however is only one of many others in front of the American Fall, and these boulders are, as it were, gigantic nuclei, round which the frozen spray accumulates, and produces the Ice-mountain of which we hear so much, and the remains of which are not unfrequently to be seen even by summer visitors. The average height of this is about half the total height of the Fall, but this winter it has attained to the unprecedented height of within twenty feet of the top of the Fall! This highest point is at about one-third of the total width of the Fall, measuring from Goat Island. Between the foot of the incline from Prospect Park and the edge of the Fall is another very high mass. The ice approaches very close to the front of the Fall, and the whole basin into which the water descends is thus closely surrounded, and partially covered, with an enormous and irregular mass of pure semi-transparent ice, of (on the day of my visit) the most beautiful emerald green hue! Later in the day I had the good fortune to fall in with Mr. Bradford, the artist who is so well known for his pictures of Greenland scenery, and in discussing the ice cones formed at waterfalls, he mentioned that, having passed a winter in the Yo Semité valley in California, he had seen an ice-cone close to one of the celebrated Falls there, which was at least 600 feet in height.

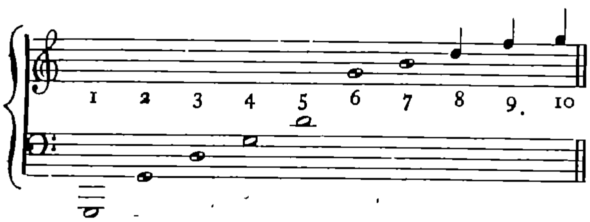
Within the last few years a considerable portion of "Table Rock" has fallen away. In its present condition a stream of water about one foot in thickness falls over it in summer, and, owing to the amount of its overhanging, it is easy to get between this Fall and the rock, and thus to be "behind Niagara." At the time of my visit (February 8th), however, the whole of this portion of the Fall was *completely frost-bound*. Enormous icicles, of the most surpassing beauty, depended from the rock above, while at my feet were masses of the frozen spray from the Horseshoe Fall. The intense emerald green of the water of that Fall, seen through and between these magnificent ice-pendants, could be reproduced by no artist, but will never be effaced from my memory. The accompanying woodcut, photographed on to the wood block from a photographic picture taken a few days prior to my visit, will, to those who know the place, give some faint idea of the beauty of the scene, and of the gigantic scale of the icicles. It is scarcely necessary to say, perhaps, that the circular wooden staircase by which the descent under Table Rock is effected, was covered with many feet thickness of ice on the side next the Fall. As the air-temperature was slightly above 32° F. and the icicles were occasionally falling around us, my guide was unwilling that I should remain long, or make any attempt to measure any of the ice-masses.

The fourth, and to the casual visitor perhaps the most remarkable effect of the cold in the immediate neighbourhood of the Falls, is the manner in which every surrounding object is coated with an immense thickness of frozen spray. The trees on Goat Island and in Prospect Park are thus covered to a slight extent, and present a very beautiful appearance. The strangest examples, however, occur on the Canadian side, close to the Horseshoe Fall, where huge irregularly-shaped masses of ice are seen, some of which resemble, in general form, merely a colossal bunch of grapes standing erect on its stalk. A little investigation shows that these are trees, staggering under the weight of tons of ice. Not unnaturally they have many broken branches, and have almost invariably lost their tips. In one instance which I saw, and of which I obtained a photograph, the spray had so accumulated in front of the trunk of a tree about nine inches in diameter, that it had formed a wall of ice *five feet* in width, and of the same thickness as the diameter of the tree-trunk. A flagstaff planted on Table Rock had four or five projections from its top, varying from three to five feet long, and looking like "frozen streamers," or as though watery flags had been flying, and had suddenly been frozen. These were so inaccessible and so dangerous to the passer-by, that they were daily shot down with rifle-bullets! The museum with its pagoda and the adjoining houses close to the Horseshoe Fall were cased with sheet-ice and pendant icicles to such an extent that much of the frozen spray had to be removed daily with an axe.

I mounted to the pagoda (well remembered, I have no doubt, by summer tourists) and there I listened to the "Music of Niagara," of which Mr. Eugene Schuyler has given in the February number of *Scribner's Magazine* an account so interesting, that I venture to conclude this article with a short abstract of it.

Mr. Schuyler starts with the statement that "the tone of Niagara was like that of the full tone of a great organ. So literally is this true that I cannot make my meanings clear without a brief outline of the construction of that great instrument." He then explains the mutual relation of the various pipes, the "ground-tone, over-tones or harmonics, and under-tones or sub-harmonics," and relates his experiences in the Cave of the Winds, on Luna Island above the Central Fall, at the Horseshoe Fall among the rapids, and at the Three Sister Islands. "In fact, wherever I was, I *could not* hear anything else! There was no *roar* at all, but the same great diapason—the noblest and completest one on earth!" Further details of visits to various points are given, and it is interesting to notice that although previously unacquainted with the difference in height of the two Falls, Mr. Schuyler unhesitatingly pronounced the Horseshoe Fall to be several feet lower than the other, guided solely by his musical ear. He then proceeds thus:—

"Now, what is this wonderful tone of Niagara? or rather, what are all these complex tones which make up the music of Niagara? With more or less variation of pitch at various points (to be accounted for), here are the notes which I heard everywhere:—



Just these tones, but *four octaves lower!*

"At once it will be incredulously replied, 'No human ear ever has heard, or ever can hear, tones at such a depth.' I arrived at my conclusions both theoretically and practically, and the two results coincided exactly." For the explanation of this, those interested will do well to consult the article itself. It may be noted here, however, that notes 3 and 4 were heard *everywhere*; that the 5th and 6th were perfectly distinct, but of far less power; that the 7th (the interval of the tenth) was of a power and clearness entirely out of proportion to the harmonics as usually heard in the organ, &c.; and that the 8th, 9th, and 10th notes were only heard occasionally and with a transient impression. Mr. Schuyler then points out that, allowing for the fact that the diameter of Niagara is the *greatest* possible compared with its height, the length of an organ-pipe necessary to give the key-note of Niagara (four octaves below note 1 in the diagram) would be just the average height of the Falls! The figures given are 170·66 feet – 10·24 feet = 160·42 feet, where the 10·24 feet is the allowance for the extra diameter of Niagara treated as an organ-pipe.

It appears, then, that the tone of Niagara is, *note for note*, the dominant chord of our natural scale in music. Its rhythm is one note per second, with three notes in each measure, the first note being the accented one, and the single beats are represented by groups of three semiquavers, where M.M. 60 = 𝅗𝅥 or three times three, three times repeated.

Mr. Schuyler thus concludes in words with which I heartily sympathise. "I have spoken only of the pitch and rhythm of Niagara. What is the *quality* of its tone? Divine! There is no other word for a tone made and fashioned by the Infinite God. I repeat, there is no *roar* at all—it is the sublimest music on earth!"

WILLIAM LANT CARPENTER

ZOOLOGICAL RESULTS OF THE VISIT OF PROF. K. MOEBIUS TO MAURITIUS[1]

THIS work, which is illustrated by a map and twenty-two plates, contains the results of the investigations of Prof. Mobius on the marine fauna of Mauritius and the Seychelle Islands, embodying the account of observations made by him on the spot, and of work done on the collections which he brought home with him on his return from his visit to the islands. It commences with an account of the journey to Mauritius in 1874-75; an account of the Suez Canal is given, and of the voyage through the Red Sea, where Trichodesmium, the yellowish-red floating algæ supposed by some to have given the name to the sea, was met with in abundance. After the well-known tanks of Aden and the Somali divers who surround every ship that comes into the port have been described, Réunion is touched at, and at last Mauritius.

A concise account is given of the geographical, geological, and climatic peculiarities of this island, which is about one-third the size of Holstein. The centre of the island is occupied by a plateau elevated over 1700 feet above sea-level, the highest point being 2711 feet in height. The plateau is surrounded on nearly all sides by mountains, and from these on all sides but the northern, where there is a gradual inclination, rivers and streams fall down very steep slopes with frequent waterfalls into the sea. Rains are very heavy, and the mountain torrents swell with remarkable rapidity. The geological structure of the island is entirely volcanic, with the exception of beds of coral rock. The mean temperature of the year is about 25°·85 C. Rain is most abundant from December to May. The prevailing wind is the south-east trade. Cyclones are sometimes experienced in the period, December to April, but do not occur every year.

Mauritius had originally no mammalian inhabitants excepting bats. The great fruit-bat (*Pteropus vulgaris*) is abundant in the woods. These fruit-bats are easily tamed. One of them was a great pet of Mr. G. Clark, now dead, who was the author of "A Brief Notice of the Fauna of the Mauritius," published in the *Mauritius Almanac* for 1859, and containing some very good observations. This tame bat was taken when young from its mother's breast and brought up by hand. It could not fly, because its wing membranes had been cut through to prevent its doing so. It usually passed its time hanging on to the back of a chair. Directly Mr. Clark came into the room it cried out loudly to be nursed. If it were not taken up at once it climbed up to him, rubbed its head against him, and licked his hands. If Mr. Clark sat down the bat hung on at once to the back of the chair, and followed all the movements of its master with its bright eyes. If its master caught hold of a fruit it climbed forthwith down his arm to his hand to get its share, and it always got two teaspoonsful out of every cup of tea or coffee. If Mr. Clark took any kind of object in his hand the bat climbed to it, examined it with its eyes and nose, and only returned to its chair-back after completely satisfying its curiosity. It followed its master even into the open air if the door was not shut to prevent its getting out.

A good many mammals have been introduced into the island, and are now abundant. A monkey from the East Indies (*Macacus cynomolgus*) inhabits the woods, and makes excursions from thence to plunder the sugar-cane fields. One of the species of the curious hedgehog-like insectivora of Madagascar (*Centetes ecaudatus*) was introduced in the island at the end of the last century. The animals live in damp places and lie in a state of sleep (= hybernation) in the dry season, sleeping then so soundly that they do not awake even when dug up. As soon as the rainy season begins in November they wake up and breed, producing three litters of fifteen or sixteen young every year. The young follow the mother, who calls them with a grunting noise, in a row behind, and protects them when molested with her teeth and spines. A full-grown male weighs as much as four pounds. The animals are so abundant that on a moonlight night with trained dogs twenty or thirty may be caught by one hunter. They are eaten by the working classes.

Besides these there is a shrew mouse, also introduced from the East Indies, a small hare, and the ubiquitous common rat, both of which latter gnaw and destroy the sugar-cane. A stag (*Cervus hippelaphas*) introduced by the Portuguese inhabits the woods. It breeds in July and August, and casts its horns in December or January.

We cannot follow the author in his short reference to the birds and account of the fish. The coral-reefs of the island appear to abound with animal life of all kinds. Several of the corals composing them are laid dry constantly at low tide, and remain exposed to the air without injury. *Goniastræa retiformis* and *Leptoria gracilis* are cited as examples of such. Whilst these corals are in this condition, the polyps remain entirely withdrawn, and the whole surface of the coral laid bare is covered with slime, which prevents its drying up.

In the Seychelles, of which a short account is given, the giant turtle (*Chelone virgata*) is kept in ponds as at Ascension, and is caught with a rope round the flipper, and dragged out to be slaughtered when convenient. The author here dug up a Cæcilian (*Cæcilia virgata*), and amused himself with the curious leaf insect (*Phyllium siccifolium*).

---

[1] Beitrage zur Meeresfauna der Insel Mauritius und der Seychellen, bearbeitet von K. Mobius, F. Richter und E. von Martens, u.s.w. (Berlin: Otto Enslin. 1880.)

The Introduction to the book is followed by a long paper by Prof. Möbius on the Foraminifera of the Mauritius, illustrated by many finely-executed plates. Amongst other Rhizopods a Haliphysema occurs, the animal which, by a most extraordinary blunder, was made out by Häckel to have a multicellular structure, and supposed to represent a Gastræa of modern times. Prof. Möbius confirms the observations of Carter, Savile Kent, and Ray Lankester, to the effect that the animal is in reality simply a Rhizopod. He has examined the structure of the Foraminiferous shells which he describes, very carefully by means of sections. He does not, however, add anything of importance to our knowledge of the structure of the soft tissues of the group.

An account of the Decapod Crustacea by Dr. F. Richter follows that of the Foraminifera. Two crabs of most extraordinary habits are described in this portion of the work. Both belong to the family Polydectinæ. The crabs of this family have their front claws armed with large teeth. Latreille, who first named the crab *Polydectes cupulifer*, remarked that a gummy substance was always to be found at the ends of the claws of this species, and Dana described the animal as having always something spongy in its hands. Dr. Mobius has discovered the remarkable fact that these things held in the two claws of the crab are in reality living sea-anemonies. These sea-anemonies are attached to the immovable joint of each claw, whilst the teeth of the movable joint of the claw are kept buried deep into the flesh of the sea-anemonies, and thus hold them fast, although each anemony can easily be pulled away from its position with the forceps in specimens preserved in spirits. The mouth of the sea-anemony is always turned away from the crab. The same curious combination exists in the case of another species of the same family but of a different genus, *Melia tessellata*, which also inhabits Mauritius. A figure is given of this crab with its pair of Actinias, named by Möbius *A. prehensa*, with fully expanded tentacles, held out one in each hand. Möbius gives the following account of the matter. "I collected about fifty male and female specimens of *Melia tessellata;* all of these held in each claw an *Actinia prehensa*. The recurved hooks of the inner margins of the claw joints of the crab are particularly well adapted to hold the Actinias fast. I never succeeded in dragging the living Actinias out without injuring them. If I left the fragments of them when pulled out lying in the vessel in which the *Melia* was, the crab collected them again into its clutch in a short time. If I cut the Actinias in pieces with the scissors, I found them all again in the claws of the crab after a few hours. It is very probable that the Actinias aid the crab in catching its prey by means of their thread-cells, and that the Actinias, on the other hand, gain by being carried from place to place by the crab, and thus brought into contact with more animals which can serve as food to them, than they would if stationary. This is a very interesting case of commensalism."

The work closes with a long account of the Mollusca of Mauritius and the Seychelles by Prof. E. von Martens.

H. N. MOSELEY

NOTES

THE centenary of the birth of George Stephenson is not to be allowed to pass by in a fruitless way in Newcastle-upon-Tyne. Dinners, speeches, trade-processions, enthusiasm and bunting—all this was to be expected in a place so intimately connected with the birth of railways. But more than this will probably be done, and we are glad to hear that a scheme is on foot for commemorating the 9th of June in a more useful and more lasting manner, viz. by providing a "Stephenson College" for the use of the houseless but hard-working College of Physical Science of the University of Durham in Newcastle.

THE French Association for the Advancement of Science has been in existence only ten years, but in that short time it has met with astonishing success, and has done some excellent work. To the fifteen sections already existing it proposes to add a sixteenth, under the name of the Section of Pedagogy, and a committee of members will discuss its formation at the forthcoming meeting at Algiers. The subjects of which the Association takes cognisance are divided into four groups, viz., Mathematical Sciences, Physical and Chemical Sciences, Natural Sciences, and Economic Sciences. A goodly list of papers has been already announced, among the authors of which we notice some of the most prominent *savans* in France. We trust, however, that the Association will not degenerate into a great excursion organisation, as to some extent it appears to have done this year. Thus the meeting lasts for six days, while the return tickets, issued in connection with the Association under very liberal terms, are good for six weeks, and no less than fifteen excursions in the neighbourhood of Algiers have been arranged. Five of these each occupy a week, and one of them a fortnight. The great number of applications for tickets both from France and Spain compel us to imagine that in many cases the membership of the Society has been sought this year rather for the sake of the tempting excursions than for the love of science. April is one of the most lovely months in the year at Algiers: the mean temperature is 16·5° C., with a possible minimum of 8°, and a possible maximum of 30°. In May the mean temperature is 19·5° C., and there may be eight days of rain; while at Biskra the maximum may be as high as 40° C. (104° F.), and not more than one day of rain may be expected in May. A proclamation has been issued by the local committee asking the inhabitants to place rooms at the disposal of the visitors. Among those who will cross the Mediterranean will be Admiral Mouchez, MM. Quatrefages, Wurtz, Saporta, the naturalist, M. Cartaillac, the geologist, and many others, who will give interesting papers on a variety of subjects.

MR. ASHTON DILKE tried in vain on Tuesday to get the House of Commons seriously to consider the advisability of adopting the decimal system of coinage in this country. It is hopeless in the present state of public affairs to induce Parliament to attend to a matter of this kind. On the widely beneficial results of the adoption of the metric system in whole or in part we have often insisted. That there would be some inconvenience in making the transition, of course every one will admit; but as compared to the ultimate benefits from the adoption of the metric system, they are not worthy of consideration. Mr. Dilke does well not to let the matter drop out entirely of public notice.

THE Thore prize of the Académie des Sciences of Paris has been awarded to M. A. Vayssière, préparateur des cours de Zoologie à la Faculté des Sciences de Marseille, for an anatomical memoir of *Prosopistoma punctifrons*, Lat. Some of our readers interested in comparative anatomy may remember having seen the original drawings in London last summer, and will be glad to know that it will soon be forthcoming. M. Vayssière is a careful expert.

THE French Minister of Public Instruction intends to do a great service to science by publishing monthly a *résumé* of the scientific work being done over France, under the title of *Revue des Sciences*. The review will be under the direction of the venerable M. H. Milne-Edwards, and will consist exclusively of analyses and summaries, but of sufficient detail to give a fair idea of the nature of the work being done. It will embrace the work of individuals and of societies all over the country, and each number will contain about 100 pages.

M. DELESSE, a member of the Institute, vice-president of the Geographical Society of Paris, and author of a number of works and papers on geology, died in Paris at the age of sixty-three years.

THE death is announced on the 25th inst. of Sir Charles Reed, M.P., the much-respected chairman of the London School Board.

A METEOROLOGICAL observatory has been erected at Port-au-Prince, Haiti, under the care of the Rev. Father Wiek, on ground granted by the State. It is an octagon of two stories and a platform. Besides the indispensable instruments it has electric clocks (for communicating the time to clocks outside), telephones, microphones, phonographs, radiometers, &c.

THE inaugural meeting of a Society of Chemical Industry will be held in the rooms of the Chemical Society, Burlington House, Piccadilly, on April 4, at 4 p.m. This Society is not intended to represent any one particular branch of chemical industry. It is hoped that it will be representative of many manufactures—alkali-making, manure-making, the textile colour industries, the glass and pottery manufactures, tar distilling, soap-making, sugar-making, brewing, metallurgy, the manufacture of fine chemicals, and all other industries which show any connection with chemical science.

THE newly-issued part of the *Medical Reports* which are from time to time issued by order of the Inspector-General of Chinese Maritime Customs, contains an elaborate monograph by Dr. Duane B. Simmons on the subject of Beriberi, or the Kakké of Japan, which includes some interesting notes on the history and geographical distribution of the disease, and is illustrated by a sketch-map.

MR. BOWDLER SHARPE, F.L.S., delivered on Thursday last the concluding lecture of a series on the "Birds of the World," which he has been giving at Tonbridge School. Throughout the winter lectures have been given on various literary and scientific subjects by Prof. Henry Morley, Rev. A. Lucas, and others, and large and attentive audiences have shown great interest in all the series. The school already possesses a small museum, which is increasing under the auspices of the present head-master, the Rev. T. B. Rowe, who is evidently doing his best to encourage a taste for science and literature in the institution under his charge.

EVERY ornithologist should read a little pamphlet recently sent to us by the Dundee Naturalists' Society, entitled "The Grallatores and Natatores of the Estuary of the Tay; the great decrease in their numbers of late years; the causes; with suggestions for its mitigation. A paper read by Col. Drummond Hay." The author, whose long residence in the district alluded to renders his experiences doubly interesting, makes out a good case for his friends the birds in regard to their alleged destruction of fish and spawn, and no doubt some notice will be taken of his statements at the approaching Fisheries' Exhibition at Norwich. The principal cause in the decrease of the birds on the Tay he attributes chiefly to the increased number of gunners on the river, who disregard the close-season, while the wilful destruction of the sea-birds' eggs also plays sad havoc amongst their numbers. Drainage and cultivation of the land has also altered the conditions under which certain species nested, and has driven them further afield.

A Conference on the reform of the Educational Code is to meet in London in the third week in April, and to sit for two days, for the purpose of drawing up a series of recommendations, to be submitted in the form of a memorial to the Vice-President of the Committee of Council. The gentlemen invited to attend are persons conversant with the practical working of the public elementary school system, head-masters of secondary schools, persons experienced in education, and others interested. Invitations have been accepted by the chairmen of the Education and School Management Committees of the School Boards for London, Liverpool, Birmingham, Leeds, Sheffield, Bristol, Bradford, Leicester, and Nottingham; also by Dr. Abbott, Dr. Caldicott, Mr. Eve, Professors Max Müller, Carey Foster, Henrici, Gladstone, and Meiklejohn; Sir U. Kay-Shuttleworth, Sir John Lubbock, the Rev. Mark Pattison, and numerous others.

MR. STEPHEN BRETTON, F.M.S., writes from Eastbourne to the *Times*, under date March 28, that he saw a meteor of great splendour that morning (1.15 a.m. Greenwich mean time), the finest he ever observed. Its size was apparently rather larger than Venus at her brightest, and for two or three seconds illuminated the heavens very brilliantly. Its colour was of an intense purple white, and moved somewhat slowly. He first noticed it a little south of Regulus, and going in direction of Castor. When immediately below Præsepe it burst into about five or six fragments, each about the size of a star of the third or fourth magnitude, these assuming a deep fiery red. It then immediately disappeared. The night was especially clear; temperature in air about 30°; barometer about 29·850.

THE Committee of the "Frank Buckland Memorial Fund" have decided that the memorial shall take the form of a bust to be placed in the Fish Museum at South Kensington; the purchase of an annuity to be presented to Mrs. Buckland; and, if there be any surplus, it will be applied in some way to promote the welfare of the fishermen of this country. The honorary secretaries are Col. Bridges and Mr. T. Douglas Murray, to whom subscriptions may be sent at 34, Portland Place.

SMART shocks of earthquake occurred at Agram on March 21 at 3h. 40m. a.m., duration three seconds, and on March 24 at 6h. 45m. a.m., both accompanied by loud subterranean noises.

THERE was another earthquake shock at Casamicciola on Sunday morning at 6.45.

M. VAN MALDEREN, who was the electrical engineer of the Alliance, and constructed the so long unrivalled magneto-electric machine belonging to this Company, died at Brussels at the age of seventy a few days ago.

ALL the obstacles which have prevented the reconstruction of the Sorbonne being accomplished, have been removed by M. Jules Ferry, and the work will begin immediately. The same may be said of the isolation of the Public Library of Paris, all the required expropriations having been decreed.

THE date for admission of exhibits to the International Exhibition of Electricity at Paris has been prolonged to April 15.

THE Geologists' Association Easter Excursion will, be on Monday and Tuesday, April 18 and 19, to Salisbury, Stonehenge, and Vale of Wardour.

COLONEL PARIS, the head of the Paris fire brigade, has concluded his report on the destruction of the Printemps Establishment by proposing that large warehouses be compelled to light by electricity. The burning of the Nice Theatre, which was occasioned by a gas explosion, has given a new importance to that movement.

M. DE MERITENS has completed the construction of one of his magneto-electric engines intended for lighthouse illumination. An experimental trial took place on March 25 before MM. Becquerel, Cornu, Mascart, and other members of the Technical Commission of the International Exhibition. It was proved that with fifteen horse-power his machine illuminates at once more than thirty Jablochkoff lights, and that it could, at a moment's notice, be used in a regulator for marine purposes.

MR. THOMAS EDWARD, the Banff naturalist, has reprinted in a separate form some useful and interesting papers on the Protection of Wild Birds. The pamphlet is to be had at the *Banffshire Journal* Office.

THE additions to the Zoological Society's Gardens during the past week include an Egyptian Gazelle (*Gazella dorcas*) from Egypt, presented by the Earl of March, F.Z.S.; a Common Genet (*Genetta vulgaris*), South European, presented by the Rev. F. P. Voules; a Giant Toad (*Bufo agua*) from Brazil, presented by Mr. Carl Hagenbeck; a Long-snouted Snake (*Passerita mycterizans*) from India, presented by Mr. H. H. Black; an Amherst's Pheasant (*Thaumalea amherstiæ*) from Szechuen, China, a Black Swan (*Cygnus atratus*) from Australia, purchased; a Tiger (*Felis tigris*), a Bactrian Camel (*Camelus bactrianus*), a Sambur Deer (*Cervus aristotelis*), born in the Gardens.

OUR ASTRONOMICAL COLUMN

A NEW VARIABLE STAR.—On July 26, 27, and 29, 1783, D'Agelet observed a star which he twice estimated 6m., and on the last night 6·5m.; it is No. 5057-9 in Gould's reduced catalogue, the mean of the three observations giving for 1800, R.A. 19h. 23m. 47·57s. and Decl. + 17° 19′ 42″·8. The only subsequent observation we have yet found of this star is in the *Durchmusterung*, where it is rated as low as 9·4m.; there is consequently a high probability that it will prove to be a remarkable variable. The position brought up to the beginning of 1880 will be R.A. 19h. 27m. 22·1s., Decl. + 17° 29′ 28″. D'Agelet's original observations will be found at pp. 542, 544, and 546 of the *Histoire Céleste* of Lalande.

MINIMA OF ALGOL, ETC., IN 1880.—Prof. Julius Schmidt has published his observations, or rather the results of his observations, of Algol and other variable stars, made at Athens during the past year. On comparing his epochs of minima with the formula in Prof. Schönfeld's last catalogue, it will be found that according to the most completely determined minima the calculation is too late by nearly half an hour. But the differences between calculation and observation are very irregular, so that if we take a mean of the whole, the true minimum would appear to be earlier than that computed by only nineteen minutes. The minima between August 28 and December 21 are here compared.

According to the observations of the same indefatigable astronomer *Mira Ceti* was at a maximum between July 20 and 25, but in 1880 it only attained about 4·2 m. A maximum of R Leporis occurred about November 9; the determination is not very certain. The intervals between maximum and minimum, and *vice versâ* of α Herculis were as irregular as usual.

THE RED SPOT UPON JUPITER'S DISK.—Dr. Jedrzejewicz has published some inferences from observations for ascertaining the time of rotation of the eastern extremity of the large red spot upon the disk of Jupiter, made at his private observatory at Plonsk during the winter of 1880-81. The instrument employed is a refractor six-inches aperture, with powers 225 to 300. In December he measured the length of the spot 9″·8, and considers that his own observations compared with those of Prof. Schmidt at Athens, indicate that the length of the spot remained unchanged during the winter. On this assumption he finds for the time of rotation 9h. 55m. 34·414s. ± 0·13s, by 174 rotations between November 25, 1880, and February 5, 1881. Prof. Schmidt from 1021 rotations between July 23, 1879, and September 17, 1880, obtained the value 9h. 55m. 34·422s. ± 0·05s. for the middle of the spot. In 1862, by observations upon a spot which he says was much darker and a more favourable object for the purpose than the spots observed by Airy and Mädler in 1834-35, and which was not much larger than the shadow of the third satellite he had found for the time of rotation 9h. 55m. 25·684s. agreeing with the previously-determined values. While the period from observations of the red spot is 9s. greater, Prof. Schmidt remarks that it agrees very nearly with that already obtained by Mr. Pratt.

THE MINOR PLANETS.—It appears that the object detected by Herr Palisa at the new Observatory of Vienna on the 23rd of last month, and which was announced as No. 220 of the small-planet group, may prove to be No. 139 *Juewa*, which had not been observed since 1874. It was discovered by the late Prof. Watson at Pekin on October 10 in that year, while he was engaged upon one of the United States expeditions for the observation of the transit of Venus, and as was reported at the time, without the aid of a chart of telescopic stars, but from his memory of their configuration about the particular spot occupied by the planet. It was observed on November 8 by Rümker at Hamburg, but the length of observation was not sufficient to determine the mean motion with any degree of accuracy: hence although the elements had been several times brought up to more recent dates by Watson, the planet had not been recovered up to last month.

By the last Berlin circular it would seem that *Ismene* will fall little short of *Hilda* in the length of its revolution, and these two minors will thus stand out as exceptional members of the group. By the latest elements the period of *Hilda* is 2860 days or 7·832 years, and that of *Ismene* 2854 days or 7·814 years.

Calculation has assigned the shortest period to No. 149 *Medusa*, but this awaits confirmation, perhaps in the next summer, when the planet should again come into opposition according to the imperfect elements at present available.

PHYSICAL NOTES

M. PLANTAMOUR continues to study with his sensitive levels the phenomena of periodic rise and fall of the ground which he has observed in Switzerland. He believes he has established a connection between these periods and those of the changes of temperature of the earth's surface, there being an annual change of level in an east-west direction corresponding with the mean temperatures of the surface during the year.

M. ROSENSTIEHL concludes from his researches on the sensations of colour recently noticed that the three fundamental colour sensations of the Young-Helmholtz-Maxwell theory correspond to the following tints of the pure spectrum. *Orange-red*, three-fourths of the distance from C to D amongst the Fraunhofer lines, a *yellow-green* three-quarters of the distance from D to E, and a *blue* situated at one-third from F towards G. The principle upon which this selection is made is that the selected tint fulfils the following conditions: (*a*) it is equidistant between two tints which are complementary to one another; (*b*) it produces with either of the other selected tints another colour having a minimum of white admixed with it. Thus the yellow-green chosen is midway between that yellow and that blue which produce the best white with one another, and it gives with the selected orange-red a yellow more intense than any known yellow pigment under equal illumination, and with the selected blue gives a green more intense than the richest green pigment.

M. HENRI BECQUEREL observes that the specific magnetism of ozone exceeds that of oxygen, and is much greater than could be accounted for by the difference in density of these two allotropic forms of the gas.

IN view of recent terrible colliery explosions in Belgium, M. Cornet has called attention (in the Belgian Academy) to a possible interference of winds, blowing in an inclined direction, with the proper ventilation of mines. Most of the "fiery" Belgian mines have two shafts, one for raising the coal and for descent of air, which, passing along the galleries, is drawn up the other shaft by a ventilating engine. The orifice of the latter shaft is generally (unlike that of the other) unsheltered by buildings; it debouches directly in the air a little above the ground. Obviously, then, a strong wind, blowing with downward inclination towards this orifice, might seriously affect the ventilating action. It is noted that one explosion in Hainaut on November 19, 1880, followed a night of very high wind which M. Cornet shows to have been capable of depressing ventilation considerably. Mines with large sections are more dangerous than others in atmospheric perturbations. The true remedy, however (in the author's opinion), is not increasing the resistance to the air-currents, but sheltering the orifices of the ventilating shafts against descending winds.

IN a recent paper on the optical structure of ice (to the Freiburg Society of Naturalists) Prof. Klocke finds that while in the ice individuals the plane of the secondary axes is fixed by the position of the principal axis, they are subject to no law as to direction in that plane.

THE phenomenon of *verglas* occurred at Urbino in Italy twice in January; and from his observations of it Prof. Serpieri concludes (*Real. Ist. Lomb. Rend.*) that surfusion of the raindrops is not indispensable to its production. Surfusion indeed accelerates it, as do also violence of wind and intense cold; but a rain with temperature not so low as zero falling into an air-current in rapid motion and below zero gives the phenomenon. It is pointed out, however, that the mist which usually accompanies verglas being driven against objects by the wind, and its particles being in a state of surfusion (the temperature being below zero), probably contributes to the general result, helping to make the ice-layer regular and uniform. If the verglas be such that the drop freezes wholly at once, the latter has probably contained many small crystals of ice.

M. MERCADIER sums up his researches on Radiophony by saying that he believes that the phenomena are due to a vibratory movement set up by the alternate heating and cooling, due to the intermittent beams of heat-rays, of the gaseous layer adjacent to the solid surface at which the radiations are absorbed; being an anterior layer in the case of solid bodies, a posterior layer in the case of transparent bodies.

M. JANSSEN has succeeded in photographing the *lumière cendrée*, or "earth-shine" on the moon when three days old: in the photograph the "continents" were to be distinguished clearly from the "seas." This disposes of the view sometimes advanced, and held, we believe, by some most eminent astronomers, that the "new moon in the arms of the old" was an optical illusion.

PROF. D. W. BEETZ, of the Technical High School of Munich, wishes us to say that in the note (vol. xxiii. p. 442) on the modulus of elasticity of rods of carbon, he, and not Herr Holtz, should have been mentioned as the author of the paper on the subject in *Wied. Ann.*

GEOGRAPHICAL NOTES

AT the meeting of the Geographical Society on Monday Mr. J. B. Minchin, who has spent some seven years in the country, read an excellent paper on Eastern Bolivia, which also included some observations on the Gran Chaco. After some preliminary remarks Mr. Minchin dwelt at length on the water-system of the country, and, speaking first of the lakes, he mentioned that between the Rivers Pilcomayo and Paraguay, in the unexplored Chaco, the Indians report the existence of a lake which no white man has ever yet seen, but which is perhaps near 22° S. lat. The rivers belong to Amazon and Plate systems, and with the exception of the Paraguay and the Itenez, they mostly have their sources among the highest summits of the Andes. The Parapite, Mr. Minchin added, is the most southerly affluent of the Amazons, which in some maps has been made to flow across the Chaco into the Paraguay. The Pilcomayo also does not, as has been thought, receive any tributaries on its course through the Chaco, so far as can be learned from the Indians. Mr. Minchin afterwards alluded to his expedition over the Matto Grosso Mountains, which he succeeded in crossing for the first time. The latter part of the paper was largely devoted to the animal and vegetable productions of Eastern Bolivia and to the commercial condition of the country. The discussion which followed turned chiefly on the route of the future into Bolivia, whether it would be most advantageous to follow the Paraguay route or develop a new one by the Madera.

MR. E. G. RAVENSTEIN has nearly completed for the Council of the Geographical Society the large map of Eastern Equatorial Africa, on which he has been engaged for nearly three years under the direction of their Scientific Purposes Committee. The original drawings will be reduced before they are engraved, and the map when published will be in twenty-four sheets, and on a scale of 1 : 1,000,000. It will take in the lake region, the Upper Congo, and the Upper Nile, and on the east coast will extend from Somali Land to a little south of the Zambesi, the precise limits of the map being from 10° N. to 20° S. lat., and from 25° to 52° E. long. A very complete bibliography of authorities, compiled *pari passu* with the map, will be published afterwards.

MR. BROUMTON, an agent of the China Inland Mission at Kweiyang-fu, in the province of Kweichow, has lately sent home an account of a visit which he had paid by invitation to the Miao-tsze tribes a short distance off. He had been told by one of them, from whom he had been learning something of the language, that in the third moon of the year his people had large gatherings in the hills, and was asked to be present at these festivities. He accordingly went and had an excellent opportunity for observing the manners and customs of this section of this comparatively unknown people. He describes their dress, the character of the festivities witnessed, the singular musical instruments used, &c. The particular tribes visited by Mr. Broumton are known as the Black (from the colour of their clothes) and the Ka-teo tribes, and live near Hwangping-chow.

MR. CARL BOCK is leaving for Siam next week, where he intends to make an excursion into the interior. His book, "The Headhunters of Borneo," will be published shortly by Messrs. Sampson Low and Co.

WE hear that Mr. Edward Whymper, who has already given an account of some phases of his South American journey to the Alpine Club and the Society of Arts, will read a paper on the Andes of Ecuador before the Geographical Society on May 9.

PRIZES OF THE PARIS ACADEMY OF SCIENCES

AT the public *séance* of the Academy on March 14 the annual distribution of prizes took place. While many of these prizes are offered for particular subjects, others are devoted to rewarding the most important advances made during the year in special departments of science.

The Grand Prize of the Mathematical Sciences was awarded to M. Halphen for work on the theory of linear differential equations.

In astronomy Mr. Stone receives the Lalande prize for his stellar researches, following those of Abbé de Lacaille, at the Cape of Good Hope; and the Valz prize goes to M. Tempel for his observations on comets. M. Vinot's labours in starting and editing *Le Ciel* are recognised by the award of the Tremont prize.

The Montyon prize of the mechanical arts is given to M. Cornut for his study of the faults of iron plates; the Poncelet prize to M. Leauté for various works; while a recompense of 1500 francs on the Bordin foundation is given to M. Lan for improved modes of combustion, diminishing the trouble and harm from smoke, &c. (in steel heating). The extraordinary prize of 6000 francs (for improving the efficacy of naval forces), and the Plumey prize, are not awarded.

In physics we find a recompense of 3000 francs given to M. Ader, on the Vaillant foundation, for improvements in phonetic telegraphy. The grand prize for researches on elasticity of crystalline bodies is not awarded.

The Jecker prize goes to M. Demarçay for important work in organic chemistry; the Gegner prize to M. Jacquelain for skill in preparing a large number of substances in a pure state, &c.

Two prizes on the Bordin foundation are awarded in geology, one to M. Gosselet for a geological sketch of the North of France, the other to MM. Falsan and Chantre for their geological monography of ancient glaciers and erratic deposits in the middle of the Rhone Valley. Recompenses on the Gay foundation are awarded to MM. Delage and Chevremont for observations on movements of the coast-line in France.

In medicine and surgery three Montyon prizes are awarded: one to Dr. Charcot for his work on localisation of disorders of the brain; another to Dr. Sappey for researches on the lymphatic apparatus of fishes; the third to Dr. Jullien for important medical researches. On the Bréant foundation M. Colin is awarded 5000 francs for physiological researches. Dr. Segond receives the Godard prize for an important work in surgery; Dr. Quinand the Barbier prize for researches on the quantity of oxygen in human blood in health and in disease. The Dusgate prize (having regard to prevention of premature burial) is not given, but MM. Onimus, Peyrand, and Le Bon are recompensed for their researches. The Boudet prize is awarded to Prof. Lister.

In experimental physiology the Montyon prize is given to M. Bonnier for researches on the nectaries and colours of plants.

The Fons-Melicocq prize for botanical research in the north of France is gained by M. de Vicq; and M. de la Chapelle receives 1000 francs on the Desmazières foundation for studies on French cryptogams.

In anatomy and zoology the Grand Prize with reference to distribution of marine animals on the French coast is withheld.

M. Grandidier gains the Savigny prize for researches on the fauna of Zanzibar and Madagascar; while the Thorel prize is awarded both to M. Vayssières and M. Joly, for observations proving a small animal found in streams to be the larva of an insect of the family of Ephemerans.

The Montyon prize for statistics goes to Dr. Ricoux for his "Figured Demography of Algeria."

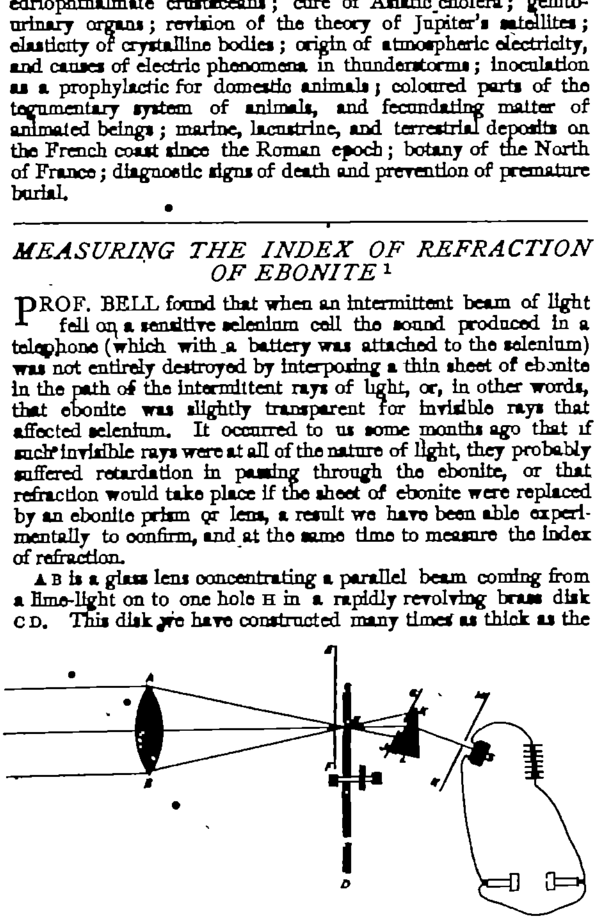
We further note that M. Birckel receives 1500 francs on the Montyon foundation, for an improvement in the Davy lamp, and that M. Dupuis receives the Delaland-Guerineau prize for his explorations in Tonkin.

The published list of subjects for prize competition in 1881, 1882, 1883, and 1885 comprises the following subjects (briefly stated) among others:—Motor for tramways; physiology of champignons; influence of environment on plant-organs; structure and development of cork; internal organisation of European edriophthalmate crustaceans; cure of Asiatic cholera; genito-urinary organs; revision of the theory of Jupiter's satellites; elasticity of crystalline bodies; origin of atmospheric electricity, and causes of electric phenomena in thunderstorms; inoculation as a prophylactic for domestic animals; coloured parts of the tegumentary system of animals, and fecundating matter of animated beings; marine, lacustrine, and terrestrial deposits on the French coast since the Roman epoch; botany of the North of France; diagnostic signs of death and prevention of premature burial.

MEASURING THE INDEX OF REFRACTION OF EBONITE[1]

PROF. BELL found that when an intermittent beam of light fell on a sensitive selenium cell the sound produced in a telephone (which with a battery was attached to the selenium) was not entirely destroyed by interposing a thin sheet of ebonite in the path of the intermittent rays of light, or, in other words, that ebonite was slightly transparent for invisible rays that affected selenium. It occurred to us some months ago that if such invisible rays were at all of the nature of light, they probably suffered retardation in passing through the ebonite, or that refraction would take place if the sheet of ebonite were replaced by an ebonite prism or lens, a result we have been able experimentally to confirm, and at the same time to measure the index of refraction.

A B is a glass lens concentrating a parallel beam coming from a lime-light on to one hole H in a rapidly revolving brass disk C D. This disk we have constructed many times as thick as the one employed by Prof. Bell, and have thus succeeded in eliminating all the sound produced by the syren action of the disk, so disturbing in delicate experiments. E F is a stationary zinc screen with a hole in it smaller than the holes in the rotating disk.



1. We first tried to focus these intermittent rays on a selenium cell by means of an *ebonite* lens, and so determine the focal length of the lens; but as our lens was then not mounted on an optical bench, so as to be moved parallel to itself, or rotated through known angles, and as the rays were invisible, so that our eyes could not of course guide us as to the proper position in which to put the lens, we failed to succeed in this very delicate experiment, which however our subsequent experiments, now to be described, show must ultimately succeed with the lens properly mounted.

2. A small portion of the intermittent light which passed through the hole H in the rotatory disk was allowed to fall on an ebonite prism K L, by passing through a slit in a zinc screen G J, the slit being arranged parallel to the edge of the ebonite prism. The prism employed had an angle of 27°·5. M N is another zinc screen with a slit in it also parallel to the edge of the prism, and placed in front of a sensitive selenium cell S (the cell described by us in the account of our experiments on "Seeing by Electricity"). This screen M N was moved parallel to itself, while an experimenter listened with a telephone to each ear, and who was placed in another room, so as not to be influenced by seeing what changes were being made in the position of the screen or in the position of the ebonite prism. The telephones had each a resistance of 74 ohms, and the battery an electromotive force of about 40 volts. No direct light falling on the selenium, the listener at the telephones heard nothing for the majority of positions of the screen M N, but in one position represented in the figure a faint distant sound was distinctly heard, which was entirely cut off by interposing the hand in front of the selenium, or by moving away the prism.

The invisible rays that affect selenium after passing through ebonite are consequently refracted, and some preliminary experiments, when the ebonite prism was arranged for minimum deviation, gave 1·7 as a first rough approximation for the index of refraction of these rays by ebonite. It is interesting to notice that the square, 2·89, of this index of refraction is between the highest and lowest limits obtained by different experimenters for the specific inductive capacity of ebonite, so far agreeing with Maxwell's electromagnetic theory of light.

We are now having prisms of ebonite and of other opaque substances of different angles mounted on a goniometer stand, to enable us to measure the indices of refraction accurately.

MOLECULAR ELECTROMAGNETIC INDUCTION[1]

THE induction-currents balance which I had the honour of bringing before the notice of the Royal Society (*Proc.* Roy. Soc. vol. xxix. p. 56) showed how extremely sensitive it was to the slightest molecular change in the composition of any metal or alloy, and it gave strong evidence of a peculiarity in iron and steel which its magnetic properties alone failed to account for. We could with all non-magnetic metals easily obtain a perfect balance of force by an equivalent piece of the same metal, but in the case of iron, steel, and nickel it was with extreme difficulty that I could obtain a near approach to a perfect zero. Two pieces of iron cut off the same bar or wire, possessing the same magnetic moment, never gave identical results; the difficulty consisted, that notwithstanding each bar or wire could be easily made to produce the same inductive reaction, the time during which this reaction took place varied in each bar; and although I could easily change its balancing power as regards inductive force by a change in the mass of the metal, by heat or magnetism, the zero obtained was never equal to that obtained from copper or silver.

This led me to suppose the existence of a peculiarity in magnetic metals which could not be accounted for except upon the hypothesis that there was a cause, then unknown, to produce the invariable effect.

Finding that it would be impossible to arrive at the true cause without some new method of investigation, which should allow me to observe the effects from an electrical circuit, whose active portion should be the iron wire itself, I constructed an apparatus or electro-magnetic induction balance, consisting of a single coil reacting upon an iron wire in its axis, and perpendicular to the coil itself; by this means the iron or other wire itself became a primary or secondary, according as the current passed through the coil or wire. Now with this apparatus we could induce secondary currents upon the wire or coil, if the coil was at any angle, except when the wire was absolutely perpendicular; in this state we could only obtain a current from some disturbing cause, and the current so obtained was no longer secondary but tertiary.

The whole apparatus however is more complicated than the general idea given above, as it was requisite not only to produce effects, but to be able to appreciate the direction of the electrical current obtained, and have comparative measures of their *value*. In order to fully understand the mode of experiments, as well as the results obtained, I will first describe the apparatus employed.

The electro-magnetic induction balance consists—(1) of an instrument for producing the new induction-current; (2) sonometer or balancing coils; (3) rheotome and battery; (4) telephone.

---

[1] Note communicated to the Royal Society by Professors Ayrton and Perry.

[1] Paper read at the Royal Society, March 17, by Prof. D. E. Hughes, F.R.S.

The essential portion of this new balance is that wherein a coil is so arranged that a wire of iron or copper can pass freely through and forming its axis, the iron or copper wire rests upon two supports 20 centims. apart; at one of these the wire is firmly clamped by two binding screws; the opposite end of the wire turns freely on its support, the wire being 22 centims. long, having 2 centims. projection beyond its support, in order to fasten upon it a key or arm which shall serve as a pointer upon a circle giving the degrees of torsion which the wire receives from turning this pointer. A binding screw allows us to fasten the pointer at any degree, and thus preserve the required stress the time required.

The exterior diameter of the coil is 5½ centims., having an interior vacant circular space of 3½ centims., its width is 2 centims.; upon this is wound 200 metres of No. 32 silk-covered copper wire. This coil is fastened to a small board so arranged that it can be turned through any desired angle in relation to the iron wire which passes through its centre, and it can also be moved to any portion of the 20 centims. of wire, in order that different portions of the same wire may be tested for a similar stress.

The whole of this instrument, as far as possible, should be constructed of wood, in order to avoid all disturbing inductive influences of the coil.

The iron wire at its fixed end is joined or makes contact with a copper wire, which returns to the front part of the dial under its board and parallel to its coil, thus forming a loop, the free end of the iron wire is joined to one pole of the battery, the copper wire under the board is joined to the rheotome and thence to the battery.

The coil is joined to the telephone; but, as in every instance we can either pass the battery through the wire, listening to its inductive effects upon the wire, or the reverse of this, I prefer, generally, in order to have no voltaic current passing through the wire, to join the iron wire and its loop direct to the telephone, passing the voltaic current through the coil.

In order to balance, measure, and know the direction of the new induction currents by means of a switching key, the sonometer (*Proc.* Roy. Soc., vol. xxix. p. 65) I described to the Royal Society is brought into the circuit. The two exterior coils of the sonometer are then in the circuit of the battery, and of the coil upon the board containing the iron wire or stress bridge. The interior or movable coil of the sonometer is then in the circuit of the iron wire and telephone. Instead of the sonometer constructed as described in my paper to the Royal Society, I prefer to use one formed upon a principle I described in *Comptes rendus*, December 30, 1878. This consists of two coils only, one of which is smaller and turns freely in the centre of the outside coil. The exterior coil being stationary, the centre coil turns upon an axle by means of a long (20 centims.) arm or pointer, the point of which moves over a graduated arc or circle. Whenever the axis of the interior coil is perpendicular to the exterior coil no induction takes place, and we have a perfect zero; by turning the interior coil through any degree we have a current proportional to this angle, and in the direction in which it is turned. As this instrument obeys all the well-known laws for galvanometers, the readings and evaluations are easy and rapid.

If the coil upon the stress bridge is perpendicular to the iron wire, and if the sonometer coil is at zero, no currents or sounds in the telephone will be perceived, but the slightest current in the iron wire produced by torsion will at once be heard; and by moving the sonometer coil in a direction corresponding to the current, a new zero will be obtained, which will not only balance the force of the new current, but indicate its value. A perfect zero however will not be obtained with the powerful currents obtained by the torsion of 2 millims. diameter iron wire; we then require special arrangements of the sonometer, which are too complicated to describe here.

The rheotome is a clockwork having a rapid revolving wheel which gives interruptions of currents in fixed cadences in order to have equal intervals of sound and silence. I employ four bichromate cells or eight Daniell's elements, and they are joined through this rheotome to the coil on the stress bridge, as I have already described.

The magnetic properties of iron, steel, nickel, and cobalt have been so searchingly investigated by ancient as well as by modern scientific authors, that there seems little left to be known as regards its molar magnetism. I use the word molar here simply to distinguish or separate the idea of a magnetic bar of iron or steel magnetised longitudinally or transversely from the polarised molecules which are supposed to produce its external magnetic effects.

Molar magnetism, whilst having the power of inducing an electric current in an adjacent wire, provided that either has motion or a change in its magnetic force, as shown by Faraday in 1832, has no power of inducing an electric current upon itself or its own molar constituent, either by motion or change of its magnetic moment. Molecular magnetism (the results of which I believe I have been the first to obtain) has no, or a very feeble, power of inducing either magnetism or an electric current in an adjacent wire, but it possesses the remarkable power of strongly reacting upon its own molar wire, inducing (comparatively with its length) powerful electric currents, in a circuit of which this forms a part.

We may have also both cases existing in the same wire; this occurs when the wire is under the influence of stress, either external or internal; it would have been most difficult to separate these two, as it was in my experiments with the induction balance without the aid of my new method.

Ampère's theory supposes a molecular magnetism or polarity, and that molar magnetism would be produced when the molecular magnetism became symmetrical; and his theory I believe is fully capable of explaining the effects I have obtained, if we admit that we can rotate the paths of the polarised molecules by an elastic torsion.

Matteucci made use of an inducing and secondary coil in the year 1847 (*Compt. rend.* t. xxiv. p. 301, 1847), by means of which he observed that mechanical strains increased or decreased the magnetism of a bar inside this coil.

Wertheim published in the *Comptes rendus*, 1852 (*Compt. rend.* t. xxv. p. 702, 1852), some results similar to Matteucci; but in the *Annales de Chimie et de Physique*, 1857 (*Ann. de Chim. et de Phys.* (3) t. l. p. 385, 3857), he published a long series of most remarkable experiments, in which he clearly proves the influence of torsion upon the increment or decrement of a magnetical wire.

Vilari showed (*Poggendorff's Annalen*, 1868) increase or diminution of magnetism by longitudinal pull according as the magnetising force is less or greater than a certain critical value.

Wiedermann (Wiedermann's "Galvanismus," p. 447), in his remarkable work, "Galvanismus," says that an iron wire through which an electric current is flowing becomes magnetised by twisting the wire. This I have repeated, but found the effects very weak, no doubt due to the weak battery I use, viz. four quart bichromate cells.

Sir W. Thomson shows clearly in his remarkable contribution to the *Phil, Trans.* Roy. Soc., entitled "Effects of Stress on the Magnetisation of Iron, Nickel, and Cobalt" (*Phil. Trans.* May 6, 1878), the critical value of the magnetisation of these metals under varying stress, and also explains the longitudinal magnetism produced by Wiedermann as due to the outside molar twist of the wire, making the current pass as in a spiral round a fixed centre. Sir William Thomson also shows clearly the effects of longitudinal as well as transversal strains, both as regards its molar magnetism and its electric conductivity.

My own researches convince me that we have in molecular magnetism a distinct and separate form of magnetism from that when we develop, or render evident, longitudinal or transversal magnetism, which I have before defined as molar.

Molecular magnetism is developed by any slight strain or twist other than longitudinal, and it is only developed by an elastic twist; for however much we may twist a wire, provided that its fibres are not separated, we shall only have the result due to the reaction of its remaining elasticity.

If we place an iron wire, say 20 centims. long, 1 millim. diameter, in the axis of the coil of the electro-magnetic balance, and if this wire is joined, as described, to the telephone, we find that on passing an electric current through the inducing coil no current is perceptible upon the iron wire; but if we give a very slight twist to this wire at its free end—one-eighteenth of a turn, or 20°—we at once hear, clear and comparatively loud, the currents passing the coil; and although we only gave a slight elastic twist of 20° of a whole turn, and this spread over 20 centims. in length, making an extremely slight molar spiral; yet the effects are more powerful than if, using a wire free from stress, we turned the whole coil 40°. The current obtained when we turn the coil, as just mentioned, is secondary, and with the coil at any angle any current produced by its action, either on a copper, silver, iron, or steel wire; in fact it is simply Faraday's discovery, but the current from an elastic twist is no longer secondary under the same conditions, but tertiary, as I shall demonstrate later on. The current passing through the coil cannot induce a current upon a wire perpendicular to itself, but the molecules of the outside of the wire, being under a greater elastic stress than the wire itself, they are no longer perpendicular to the centre of the wire, and consequently they react upon this wire as separate magnets would upon an adjacent wire. It might here be readily supposed that a wire having several twists, so a fixed molar twist of a given amount would produce similar effects. It however does not, for in most cases the current obtained from the molar twists are in a contrary direction to that of the elastic torsion. Thus, if I place an iron wire under a right-handed elastic twist of 20° I find a positive current of 50° sonometer; but if I continue this twist so that the index makes one or several entire revolutions, thus giving a permanent molar twist of several turns, I find upon leaving the index free from any elastic torsion, that I have a permanent current of 10°, but it is no longer positive but negative, requiring that we should give an elastic torsion in the previous direction, in order to produce a positive current. Here a permanent elastic torsion of the molecules is set up in the contrary direction to its molar twist, and we have a negative current, overpowering any positive current which should have been due to the twisted wire.

The following table shows the influence of a permanent twist, and that the current obtained when the wire was freed from its elastic torsion was in opposition to that which should have been produced by the permanent twist. Thus a well-softened iron wire 1 millim. in diameter, giving 60° positive current for a right-handed elastic torsion of 20°, gave after 1°·80 permanent torsion a negative current of 10°.

1	complete	permanent torsion	(right-handed) negative	...	10
2	"	"	"	...	15
3	"	"	"	...	15
4	"	"	"	..	16
5	"	"	"	...	12
6	"	"	"	...	10
7	"	"	"	...	5
8	"	"	"	...	4
9	"	"	"	...	3
10	"	"	"	...	3

At this point the fibres of a soft wire commence to separate, and we have no longer a complete single wire, but a helix of separate wires upon a central structure.

If now, instead of passing the current through the coil, I pass it through the wire, and place the telephone upon the coil circuit, I find that I obtain equally as strong tertiary currents upon the coil as in the previous case, although in the first case there was produced longitudinal electro-magnetism in the perpendicular wire by the action of the coil, but in the latter case none or the most feeble electro-magnetism was produced, yet in these two distinct cases we have a powerful current produced not only upon its own wire, but upon the coil, thus proving that the effects are equally produced both on the wire and coil.

If we desire, however, in these reversible effects to produce in both cases the same electromotive force, we must remember that the tertiary current when reacting upon its own short wire produces a current of great quantity, the coil one of comparative higher intensity. We can, however, easily convert the great quantity of the wire into one of higher tension by passing it through the primary of a small induction coil whose resistance is not greater than one ohm. We can join our telephone, which may be then one of a high resistance, to the secondary of this induction coil, and by this means, and without changing the resistance of the telephone, receive the same amount of force, either from the iron wire or the coil.

Finding that iron, steel, and all magnetic metals produce a current by a slight twist, if now we replace this wire by one of copper or non-magnetic metals we have no current whatever by an elastic twist, and no effects, except when the wire itself is twisted spirally in helix; and whatever current we may obtain from copper, &c., no matter if from its being in spiral or from not being perpendicular to the axis of the coils, the currents obtained will be invariably secondary and not tertiary. If we replace the copper by an iron wire, and give it a certain fixed torsion, not passing its limit of elasticity, we find that no increase or decrease takes place by long action or time of being under strain. Thus a wire which gave a sonometric force of 50° at the first observation remained perfectly constant for several days until it was again brought to zero by taking off the strain it had received. Thus we may consider that as long as the wire preserves its elasticity, exactly in the same ratio will it preserve the molecular character of its magnetism.

It is not necessary to use a wire to produce these effects; still more powerful currents are generated in bars, ribbons, or sheets of iron; thus no matter what external form it may possess, it still produces all the effects I have described.

It requires a great many permanent twists in a wire to be able to see any effect from these twists, but if we give to a wire, 1 millim. diameter, forty whole turns (or until its fibres become separated) we find some new effects; we find a small current of 10° in the same direction as its molar twist, and on giving a slight twist (20°) the sonometric value of the sound obtained is 80° instead of 50°, the real value of a similar untwisted wire; but its explanation will be found by twisting the wire in a contrary direction to its molar twist. We can now approach the zero but never produce a current in the contrary direction, owing to the fact that by the spiral direction, due to the fibrous molar turns, the neutral position of its molecule is no longer parallel with its wire, but parallel with its molar twist, consequently an elastic strain in the latter case can only bring the molecules parallel with its wire, producing no current, and in the first case the angle at which the reaction takes place is greater than before, consequently the increased value of its current.

The measurements of electric force mentioned in this paper are all sonometric on an arbitrary scale. Their absolute value has not yet been obtained, as we do not, at our present stage, require any except comparative measures.[1] Thus, if each wire is of 1 millim. diameter and 20 centims. long, all render the same stress in the axis of its coil. I find that the following are the sonometric degrees of value:—

Soft iron	... ...	60°	Tertiary current.
Hard drawn iron...	... ...	50	" "
Soft steel	... ...	45	" "
Hard tempered steel	.. ..	10	" "
Copper, silver, &c.	... ...	−0	" "
Copper helix, 1 centim. diameter, 20 turns in 20 centims.	... ...	45	Secondary currents.
Iron, spiral, ditto	... ...	45	" "
Steel	.. ..	45	" "

The tertiary current increases with the diameter of the wire, the ratio of which has not yet been determined; thus an ordinary hard iron wire of 1 millim. diameter giving 50°, one of 2 millims. diameter gave 100°; and the maximum of force obtained by any degree of torsion is at or near its limit of elasticity, as if in the same time we also pass this point, producing a permanent twist, the current decreases, as I have already shown in the case of a permanent twist. Thus, the critical point of 1 millim. hard iron wire was 20° of torsion, but in hard steel it was 45°.

Longitudinal strains do not produce any current whatever, but a very slight twist to a wire, under a longitudinal strain, produces its maximum effects: thus, 20° of torsion being the critical point of iron wire, the same wire, under longitudinal strain, required but from 10° to 15°. It is very difficult however to produce a perfect longitudinal strain alone. I have therefore only been able to try the effect of longitudinal strain on fine wires, not larger than 1 millim in diameter, but as in all cases no effect whatever was produced by longitudinal strain alone, I believe none will be found if absolutely free from torsion. The molecules in a longitudinal strain are equally under an elastic strain as in torsion, but the path of their motion is now parallel with its wire, or the zero of electric inductive effect, but the compound strain composed of longitudinal and transverse, react upon each other, producing the increased effect due to the compound strain.

The sonometer is not only useful for showing the direction of the current and measuring it by the zero method, but it also shows at once if the current measured is secondary or tertiary. If the current is secondary its period of action coincides with that of the sonometer, and a perfect balance, or zero of sound, is at once obtained, and its value in sonometric degrees given, but if the current is tertiary, no zero is possible, and if the value of the tertiary is 60°, we find 60° the nearest approach to zero possible. But by the aid of separate induction coils to convert the secondary into a tertiary, a perfect zero can be obtained if the time of action and its force correspond to that which we wish to measure.

---

[1] 50° sonometer has the same electromotive force as 0°·10 of a Daniell battery.

If I place a copper wire in the balance and turn the coils at an angle of 45°, I obtain a current which can be perfectly balanced by the sonometer at 50°, proving, as already said, that it is secondary. If I now replace the copper by an iron wire, the coil remaining at 45°, I have again exactly the same value for the iron as copper, viz., 50°, and in both cases secondary. Now, it is evident that in the case of the iron wire there was produced at each passage of the current a strong electro-magnet, but this longitudinal magnetism did not either change the character of the current or its value in force.

A most beautiful demonstration of the fact that longitudinal magnetism produces no current, but that molecular magnetism can act equally as well, no matter the direction of the longitudinal magnetism, consists in forming an iron wire in a loop, or taking two parallel but separate wires, joined electrically at their fixed ends, the free ends being each connected with the circuit, so that the current generated must pass up one wire and down the adjacent one. On testing this loop, and if there are no internal strains, complete silence or absence of current will be found. Now, giving a slight torsion to one of these wires in a given direction, we find, say 50° positive; twisting the parallel wire in a similar direction produces a perfect zero, thus, the current of the second must have balanced the positive of the first. If, instead of twisting it in similar directions, we twist it in the contrary direction, the sounds are increased in value from 50° positive to 100° positive, showing, in this latter case, not only a twofold increase of force, but that the currents in the iron wires travelled up one wire and down the other, notwithstanding that both were strongly magnetic by the influence of the coil in one direction, and this experiment also proves that its molar magnetism had no effect, as the currents are equally strong in both directions, and both wires can double or efface the currents produced in each. If instead of two wires we take four, we can produce a zero, or a current of 200°, and with twenty wires we have a force of 1000°, or an electromotive force of two volts. We have here a means of multiplying the effects by giving an elastic torsion to each separate wire, and joining them electrically in tension. If loops are formed of one iron and one copper wire, we can obtain both currents from the iron wire, positive and negative, but none from the copper, its *rôle* is simply that of a conductor upon which torsion has no effect.

I have already mentioned that internal strains will give out tertiary currents without any external elastic strain being put on. In the case of iron wire these disappear by a few twists in both directions, but in flat bars or forged iron they are more permanent; evidently portions of these bars have an elastic strain, whilst other portions are free, for I find a difference at every inch tested: the instrument however is so admirably sensitive and able to point out not only the strain but its direction, that I have no doubt its application to large forged pieces, such as shafts or cannon, would bring out most interesting results, besides its practical utility; great care is therefore necessary in these experiments that we have a wire free from internal strains, or that we know their value.

Magnetising the iron wire by a large steel permanent magnet has no effect whatever. A hard steel wire thus placed becomes strongly magnetic, but no current is generated, nor has it any influence upon the results obtained from molecular movement, as in elastic torsion. A flat wide iron or steel bar shows this better than iron wire, as we can here produce transversal instead of longitudinal, but neither shows any trace of the currents produced by molecular magnetism. I have made many experiments with wires and bars thus magnetised, but as the effect in every case was negative when freed from experimental errors, I will not mention them; but there is one very interesting proof which the instrument gives, that longitudinal magnetism first passes through its molecular condition before and during the discharge or recomposition of its magnetism. For this purpose, using no battery, I join the rheotome and telephone to the coil, the wire having no exterior circuit. If I strongly magnetise the two ends of the wire, I find by rapidly moving the coil that there is a Faradaic induction of 50° at both poles, but very little or none at the centre of the wire; now fixing the coil at the central or neutral point of the wire and listening intently, no sounds are heard, but the instant I give a slight elastic torsion to the free pole, a rush of electric tertiary induction is heard, whose value is 40°. Again, testing this wire by moving the coil, I find only a remaining magnetism of 10, and upon repeating the experiment of elastic torsion I find a tertiary of 5; thus we can go on gradually discharging the wire, but its discharge will be found to be a recomposition, and that it first passed through the stage I have mentioned.

Heat has a very great effect upon molecular magnetic effects. On iron it increases the current, but in steel the current is diminished. For experimenting on iron wire, which gave a tertiary current of 50° positive (with a torsion of 20°), upon the application of the flame of a spirit-lamp the force rapidly increases (care being taken not to approach red-heat) until the force is doubled, or 100 positive. The same effects were obtained in either direction, and were not due to a molar twist or thermo-current, as if care had been taken to put on not more than 10° of torsion, the wire came back to zero at once on removal of the torsion. Hard tempered steel, whose value was 10° whilst cold, with a torsion of 45°, become only 1° when heated, but returned (if not too much heated) to 8° when cold. I very much doubted this experiment at first, but on repeating the experiment with steel several times I found that on heating it I had softened the extreme hard (yellow) temper to that of the well-known blue temper. Now at blue temper, hot, the value of steel was but 1° to 2°, whilst soft iron of a similar size gave 50° of force cold, and 100° at red heat. Now as I have already shown that the effects I have described depend on molecular elasticity, it proves at least, as far as iron and steel are concerned, that a comparatively perfect elastic body, such as tempered steel, has but slight molecular elasticity, and that heat reduces it, but that soft iron, having but little molar elasticity, has a molecular elasticity of a very high degree, which is increased by heat.

The objects of the present paper being to bring the experimental facts before the notice of the Royal Society, and not to give a theoretical solution of the phenomena, I will simply add that if we assume with Poisson that the paths of the molecules of iron are circles, and that they become ellipses by compression or strain, and also that they are capable of being polarised, it would sufficiently explain the new effects.

Joule has shown that an iron bar is longer and narrower during magnetisation than before, and in the case of the transverse strain the exterior portions of the wire are under a far greater strain than those near the centre, and as the polarised ellipses are at an angle with the molecules of the central portions of the wire, its polarisation reacts upon them, producing the comparatively strong electric currents I have described.

SCIENTIFIC SERIALS

Transactions and Proceedings of the Botanical Society of Edinburgh, vol. xiv., part 1, 1881, contains—Address by the president, Dr. T. A. G. Balfour (this address gave brief obituary of J. M'Nab, Sir W. C. Trevelyan, Dr. M. Bain, Prof. Grisebach, A. Forbes, A. J. Adie, Dr. J. Cumming, Karl Koch, Dr. J. Murchison, Dr. D. Moore, P. S. Robertson, Wm. Mudd, Dr. J. F. Th. Inmisch, S. Hay, Dr. M. A. E. Wilkinson, Rev. W. B. Cunningham, E. V. Sandilands, and A. Graham).—Dr. W. Traill, on the growth of *Phormium tenax* in the Orkney Islands.—Wm. Gorrie, on the hardiness of New Zealand plants (1878-79).—Prof. G. Lawson, on British-American species of Viola.—S. Grieve, flora of Colonsay and Oransay.—Jas. Blaikie, botanical tour in Engadine.—Sir R. Christison, on the measurement of trees.—Prof. J. H. Balfour, on *Rheum nobile*.—P. M. Thomson, the flowering plants of New Zealand, and their relation to the insect fauna.—J. Sadler, on the flowering of *Yucca gloriosa*.—Prof. Dickson, on the septa across the ducts in *Bougainvillea glabra* and *Testudinaria elephantipes*.

Proceedings of the Linnean Society of New South Wales, vol. v., parts 1 and 2 (1880).—F. M. Bailey, medicinal plants of Queensland; on Queensland ferns, with descriptions of two new species; on a new species of Nepenthes.—M. A. Haswell, on some Queensland Polyzoa, plates 1 to 3; on some new Amphipods, plates 5 to 7.—Wm. Macleay, on a new species of Galaxias, with remarks on the distribution of the species; on a new species of Otolithus and of Synaptura.—Rev. E. T. Woods and F. M. Bailey, on the fungi of New South Wales and Queensland.—Rev. E. T. Woods, on the littoral marine fauna of North-East Australia; on a fossiliferous bed at the mouth of the Endeavour River; on the habits of some Australian Echini.—E. P. Ramsay, on a new species of Oligorus; note on *Galeo-*

cerdo Rayneri.—Prof. Ralph Tate, rectification of the nomenclature of *Purpura anomala*, Angas.—E. Meyrick, descriptions of Australian Microlepidoptera; parts 3 and 4, Tineina.—J. Brazier, on a new variety of *Bulimus Caledonicus*.

SOCIETIES AND ACADEMIES

LONDON

Chemical Society, March 17.—Prof. Roscoe, president, in the chair.—The following papers were read:—On the volume of mixed liquids, by F. D. Brown. The author has determined with very great care the alteration in volume which takes place when various liquids are mixed. The liquids experimented with were carbon disulphide and benzene, carbon disulphide and carbon tetrachloride, carbon tetrachloride and benzene, dichlorethane and benzene, dibromethane and benzene, and carbon tetrachloride and toluene. The experiments were made at 20° C. The author concludes that these changes of volume are dependent on the chemical character of the molecules, and not on such physical properties as vapour tension, molecular volume, &c.—On the action of alcohol on mercuric nitrate, by R. Cowper. When mercury is dissolved in twelve times its weight of nitric acid (1·3), the solution allowed to stand until all nitrous fumes have escaped, and twelve parts by weight of pure alcohol added, a crystalline precipitate is formed, with or without heating, which the author has investigated; it has the constitution $(C_2H_2Hg_2O_2)(NO_3)_2$; he has also prepared the hydrate and oxalate of the dyad radical $(C_2H_2Hg_2O_2)$.—On boron hydride, by F. Jones and R. L. Taylor. Magnesium boride is first prepared by heating a mixture of recently-ignited boric anhydride, with twice its weight of magnesium-dust, in a covered crucible. On treating the magnesium boride with hydrochloric acid, boron hydride is obtained, always however mixed with a large excess of hydrogen. Its composition is probably BH_3; it resembles in many of its properties arsine (AsH_3) and stibine (SbH_3).—On the action of aldehydes on phenanthraquinone in presence of ammonia, by F. R. Japp and E. Wilcock.—On the action of benzoic acid on naphthaquinone, by F. R. Japp and N. H. J. Miller.—Note on the appearance of nitrous acid during the evaporation of water, by R. Warington. The author proves that the nitrous acid is always derived from the atmosphere or from the products of combustion from the source of heat used for evaporating; he also gave some account of the marvellously delicate test proposed by Griess for nitrous acid. The solution is acidified, and some sulphanilic acid with some hydrochlorate of naphthylamin added; if nitrous acid be present, equal to one part of nitrogen in 1000 millions of water; a rose-red tint is developed.—On the sweet principle of *Smilax glycyphylla*, by Dr. Wright and Mr. Rennie.—Note on usnic acid and some products of its decomposition, by the late J. Stenhouse and C. E. Groves.—On the absorption of solar rays by atmospheric ozone, and on the blue tint of the atmosphere, by W. N. Hartley. The author concludes that the higher regions of the atmosphere contain much more ozone than the layers near the earth's surface, and that the blue tint of the atmosphere is largely due to ozone.—On the nature of certain volatile products contained in crude coal-tar benzenes, by Watson Smith.—On New Zealand Kauri gum, by E. H. Rennie. On distillation this gum yields a terpene, boiling at 157°–158°.

Geological Society, March 9.—Robert Etheridge, F.R.S., president, in the chair.—Robert Thompson Burnett, William Erasmus Darwin, Charles James Fox, and the Rev. T. Granger Hutt were elected Fellows of the Society.—The following communications were read:—Description of parts of the skeleton of an Anomodont reptile (*Platypodosaurus robustus*, Ow.); Part II. The Pelvis, by Prof. Owen, C.B., F.R.S. In this paper the author described the remains of the pelvis of *Platypodosaurus robustus*, which have now been relieved from the matrix, including the sacrum, the right "os innominatum," and a great part of the left ilium. There are five sacral vertebræ, which the author believes to be the total number in *Platypodosaurus*. The neural canal of the last lumbar vertebra is 8 lines in diameter, and of the first sacral 9 lines, diminishing to 6 lines in the fifth, and indicating an expansion of the myelon in the sacral region, which is in accordance with the great development of the hind limbs. The sacral vertebræ increase in width to the third; the fourth has the widest centrum. This coalescence of the vertebræ justifies the consideration of the mass, as in Mammalia, as one bone or "sacrum," which may be regarded as approaching in shape that of the Megatherioid mammals, although including fewer vertebræ. Its length is 7½ inches; its greatest breadth at the third vertebra, 5½ inches. The ilium forms the anterior and dorsal walls of the acetabulum, the posterior and postero-ventral walls of which are formed by the ischium and pubis. The diameter of its outlet is 3 inches, the depth of the cavity 1½ inch; at its bottom is a fossa 1¼ inch broad. The foramen is subcircular, 1 inch in diameter. The ventral wall of the pelvic outlet is chiefly formed by the pubis; it is a plate of bone 6 inches broad, concave externally, convex towards the pelvic cavity. The subacetabular border is 7–8 lines thick; it shows no indication of a pectineal process, or of a prominence for the support of a marsupial bone. The author remarks that of all examples of pelvic structure in extinct Reptilia this departs furthest from any modification known in existing types, and makes the nearest approach to the Mammalian pelvis. This is shown especially by the number of sacral vertebræ and their breadth, by the breadth of the iliac bones, and by the extent of confluence of the expanded ischia and pubes.—On the order Theriodontia, with a description of a new genus and species (*Ælurosaurus felinus*, Ow.), by Prof. Owen, C.B., F.R.S. The new form of Theriodont reptile described by the author in this paper under the name of *Ælurosaurus felinus* is represented by a skull with the lower jaw, obtained by Mr. Thomas Bain from the Trias of Gough, in the Karoo district of South Africa. The post-orbital part is broken away. The animal is mononarial; the alveolar border of the upper jaw is slightly sinuous, concave above the incisors, convex above the canines and molars, and then straight to beneath the orbits. The alveolar border of the mandible is concealed by the overlapping teeth of the upper jaw; its symphysis is deep, slanting backward, and destitute of any trace of suture; the length of the mandible is 3¼ inches, which was probably the length of the skull. The incisors are $\frac{5-5}{5-5}$, and the molars probably $\frac{5-5}{5-5}$ or $\frac{6-6}{6-6}$, all more or less laniariform. The length of the exserted crown of the upper canine is 12 millims.; the root of the left upper canine was found to be twice this length, extending upwards and backwards, slightly expanded, and then a little narrowed to the open end of the pulp-cavity. There is no trace of a successional canine; but the condition of the pulp-cavity and petrified pulp would seem to indicate renewal of the working part of the canine by continuous growth. The author infers that the animal was monophyodont. *Ælurosaurus* was said to be most nearly allied to *Lycosaurus*, but its incisor formula is Dasyurine. With regard to the characters of the Theriodontia the author remarked that we may now add to those given in his "Catalogue of South African Fossil Reptiles" that the humerus is perforated by an entepicondylar foramen and the dentition monophyodont.—Additional observations on the superficial geology of British Columbia and its adjacent regions, by G. M. Dawson, D.Sc. This paper is in continuation of two already published in the Society's *Journal* (vol. xxxi. p. 603, and vol. xxxv. p. 89). In subsequent examinations of the southern part of the interior of British Columbia the author has been able to find traces of glaciation in a north to south direction as far as or even beyond the 49th parallel. Iron Mountain, for instance, 3300 feet above the neighbouring valleys, 5280 feet above the sea, has its summit strongly ice-worn in direction N. 29° W. to S. 29° E. Other remarkable instances are given which can hardly be explained by local glaciers; boulder-clay is spread over the entire district; terraces are cut in the rearranged material of this, bordering the river-valleys, and at greater elevations expanding over the higher parts of the plateau and mountains. At Mount It-ga-chuz they are 5270 feet above the sea. The author considers that the higher terraces can only be explained by a general flooding of the district. Some of the wide trough-like valleys of the plateau contain a silty material which the author regards as a glacial mud. North of the 54th parallel and west of the Rocky Mountains similar evidence of glaciation is obtained; erratics are found in the Peace and Athabasca basins. The fiords of British Columbia are extremely glaciated, the marks being generally in conformity with the local features; terraces are scarce and at low levels. The Strait of Georgia was filled by a glacier which overrode the south-east part of Vancouver's Island; evidence is given to show that this ice came from the neighbouring mountainous country. Queen Charlotte's Island shows evidence of local glaciation. Boulder-clays and stratified drifts are found, with occasional Arctic shells. The author considers that the most probable explanation of the phenomena of the whole region is to suppose the former existence of a great glacier mass resembling the inland ice of Greenland, and that the Glacial period was closed by a general submergence, during which the drifts were deposited and, at its close, the terraces cut.

Photographic Society, March 8.—J. Glaisher, F.R.S., president, in the chair.—Papers were read by Mr. Payne Jennings on art photography. It was asserted that unfavourable criticisms, both from artists and the press, had been the result from the exhibition of works which deserved such severity, and that to raise the status of art in photography more attention must be given to art-rules.—Also by Mr. Edwin Cocking, on notes on photography and art. An incisive comparison was drawn between the art of the painter and that of the photographer, showing the essential difference between the two in the production of a pictorial work, both in the *modus operandi* of production and the individuality capable of being infused into each result. Also that art in photography required a totally different training to that necessary for the painter, and that the time had arrived when special instruction by a thoroughly organised school for art photography had become absolutely necessary.

Institution of Civil Engineers, March 22.—Mr. Abernethy, F.R.S.E., president, in the chair.—The paper read was on the comparative endurance of iron and mild steel when exposed to corrosive influences, by Mr. D. Phillips, M. Inst. C.E.

PARIS

Academy of Sciences, March 21.—M. Wurtz in the chair.—The following papers were read:—On determination of the masses of mercury, Venus, the Earth, and of solar parallax, by M. Tisserand.—Observations of Faye's comet, at Paris Observatory, by MM. Tisserand and Bigourdan.—On the possibility of making sheep refractory to anthrax through preventive inoculations, by M. Pasteur, with MM. Chamberland and Roux. M. Pasteur controverts M. Toussaint's views on the subject, and says his method is very uncertain.—The vaccine matter of anthrax, by the same. A wholly harmless bacterium can be got from the most virulent by cultivation in animals different from those apt to take the disease. There are as many distinct germs as there are different kinds of virulence.—Researches on formic ethers, by MM. Berthelot and Ogier. They are formed with absorption of heat.—New navigation-maps, giving both the direction and force of the wind in the Indian Ocean, by M. Brault. Meteorologically the parts of that ocean above and below the equator are distinct (and the author indicates how).—On the operations of the Syndical Association of the Beziers Arrondissement to oppose phylloxera, by M. Jaussan.—Report on the work of the Council of Public Hygiène and Salubrity, by M. Bresançon.—On the surface with sixteen singular points and Θ functions with two variables, by M. Darboux.—On the functional determinant of any number of binary forms, by M. Le Paige.—On the decomposition into primary factors of uniform functions having a line of essential singular points, by M. Picard.—On certain simultaneous linear differential equations with partial derivatives, by MM. Picard and Appell.—On generator polygons of a relation between several imaginary variables, by M. Lecornu.—Solution of a general problem on series, by M. André.—On linear differential equations with algebraic integrals, by M. Poincaré.—On the distribution of energy in the normal solar spectrum, by Prof. Langley. The total heat coming from the sun to the earth is much greater than has been believed (even in estimates accused of exaggeration). If the totality of the solar radiations reached us we should have a sensation of blue rather than white. (The author studied the absorption for each ray).—On a synthetic apparatus reproducing the phenomenon of circular double refraction, by M. Gouy. This consists of a number of thin and narrow rectangular lamellæ of crystal placed side by side like floor-boards, and cemented between two glass plates. In a given direction the optic axis of each band forms a constant angle with the preceding one. A half-wave plate is placed above.—On radiophony with selenium, by M. Mercadier. The sounds here result chiefly from the luminous rays from the limit of blue to extreme red, and even a little in infra-red, the maximum being in the yellow.—Experiments at the Creusot works in optical measurement of high temperatures, by M. Crova. The spectropyrometer is proved practically useful.—On the electromotive force of the voltaic arc, by M. Le Roux. With a galvanometer of great resistance and a single contact operated with the hand, one may prove the difference of potential of the carbons even $\frac{1}{10}$ of a second after cessation of the current. The phenomenon is probably thermo-electric.—The hissing of the voltaic arc, by M. Mandet. The difference of potential between the carbons is very great when the arc is silent, very small when it hisses.—On magic mirrors of silvered glass, by M. Laurent. The magic effect can be had through the mode of mounting of the mirror.—On the flow of gases, by M. Neyreneuf. The laws of this may be verified by a method like that for determining electric resistances.—On new combinations of hydrobromic and hydriodic acid with ammonia, by M. Troost.—Action of hydrochloric acid on chloride of lead, by M. Ditte.—Action of sulphuric acid newly heated to 320°, and oils, by M. Maumené.—On a new means of analysis of oils, by the same. This consists in treating a measured quantity of oil with one of a titrated aqueous solution of caustic alkali.—Separation of oxide of nickel and oxide of cobalt, by M. Delvaux.—On a process of industrial manufacture of carbonate of potash, by M. Engel.—On some complex compounds of sulphur and nitrogen, by M. Demarçay.—On tar from cork, by M. Bordet. It contains more hydrocarbons than tar from coal, and less of oxygenated substances than tar from hard woods.—On the fermentation of urea, by M. Richet. The stomachal mucus of animals in general causes ammoniacal fermentation of pure urea.—Physiological and therapeutical properties of cedrine and valdivine, by MM. Dujardin-Beaumetz and Restrepo.—Physiological action of *Erythrina corallodendron*, by MM. Bochefontaine and Rey.—On lesions of the bones in locomotor ataxy, by M. Blanchard.—On the presence of trichina in adipose tissue, by M. Chatin.—On the virulent state of the fœtus in sheep dead from symptomatic anthrax, by MM. A. Arloing, Cornevin, and Thomas.—Illusion relative to the size and distance of objects from which one withdraws, by M. Charpentier. The objects seem to enlarge on approach.—On the organs of taste of osseous fishes, by M. Jourdan.—Toxical power of pancreatic microzymas in intravenous injections, by MM. Béchamp and Baltus.—Human bones found in the diluvium of Nice—the geological question, by M. Desor. The deposit (at Carabacel) belongs to the category of strata contemporary with the erosion of tertiary plateaux.—Description of the bones, by M. Niepce.—Determination of the race, by M. de Quatrefages. It seem to be the same as that of the men of Cro-Magnon.—On a new genus of primary fish, by M. Gaudry. MM. Riche found it in the Permian of Igornay. It is remarkable for the great size of its ribs, and is called *Megapleuron Rochei*. It had lozenge scales.—On the existence and characters of the Cambrian formation in the Puy-de-Dôme and Allier, by M. Jullien.—General law of formation of mineral waters; application to Greoux (Basses-Alpes), by M. Dieulafait.—On the discovery at Noir-Montiers (Vendée) of the Eocene flora with *Sabalites Andegavensis*, Sch., by M. Crié.—Observations on variations of temperature of the human body during movement, by M. Villari. The results agree with M. Bonnal's.

THE ARYAN VILLAGE

The Aryan Village in India and Ceylon. By Sir John B. Phear. (London: Macmillan and Co., 1880)

IT is now twenty years since a remarkable page in Sir Henry Maine's "Ancient Law" drew attention to the prevalence in India of the village-community, a system of society strange to the modern English mind. Before that work appeared, even special students had little idea how far the ancient communism, under which the Aryan race colonised so much of Asia and Europe, was still to be found not as a mere relic of ancient society, but as the practical condition of modern life among Hindus and Slavs. The historical importance of this early institution is now fully recognised, and our archæologists are alive to the relics of the old village-communities in England. Not only are these seen in the public commons, but here and there in certain fields where, after harvest, the neighbours still have the right of turning their cattle in among the stubbles, while even a few of the great old "common fields," where once each family had its free allotted portion, are still to be discerned by the baulks or ridges of turf dividing them into the three long strips, which again were cut crosswise into the family lots. Thus every contribution to the argument on the development of modern landholding from the communism of ancient times, finds interested readers. The present volume is such a contribution, and in several ways new and important. Sir John Phear thoroughly knows and carefully describes native life in Bengal and Ceylon, and one of his points is the remarkable parallelism of the agricultural village, as it has shaped itself in these two widely-separated districts. Up to a certain stage, the development of the village-community has been everywhere on much the same lines, and those not hard to trace. It springs naturally out of the patriarchal family, which, living together on its undivided land, tilling it in common, and subsisting on the produce, becomes in a few generations a family-community. There are now to be seen in and about Calcutta families of 300 to 400 (including servants) living in one house, and 50 to 100 is a usual number. The property is managed by the *karta*, who is usually the eldest of the eldest branch, and what the members want for personal expenses beside the common board and lodging, he lets them have in small sums out of the common fund. Now and then there is a great quarrel, when the community breaks up and the land is divided according to law. It is easily seen how such a joint-family or group of families settling together in waste unoccupied land would expand into a village-community, where new households when crowded out of the family home would live in huts hard by, but all would work and share together as if they still dwelt under one roof. In fact this primitive kind of village-settlement, according to our author, is still going on at this day in Ceylon. In districts where, as in ancient Europe, patches of forest are still felled and burnt to give a couple of years' crop of grain, and where in the lowlands rice-cultivation requires systematic flooding, we find the whole settlement at work in common in a thoroughly socialistic way. The somewhat different communistic system prevails more in India, where the land is still the common property of the village, and the cultivated plots are apportioned out from time to time among the families, but these families labour by and for themselves, pay the rent or tax, and live each on the crop of their own raising. In Bengal a step toward our notion of proprietorship is made, where custom more and more confirms each family in permanent ownership of the fields which their fathers have long tilled undisturbed. Tenant-right, so pertinaciously remembered by the Irish peasant, is older in history than the private ownership of land. Next, in the Hindu village as it now exists, a further stage of social growth appears. Families carrying on certain necessary professions have been set apart, or have settled in the village. The hereditary carpenters and blacksmiths and potters follow their trades, the hereditary washerman washes for his fellow-villagers, and the hereditary barber shaves them, paid partly for their services at fixed customary rates, and partly by having their plots of village-land rent free, or nearly so. All this is intelligible and practical enough, and indeed strongly reminds those of us who got our early politics out of "Evenings at Home," of the boy colonists providing for their future wants under the direction of discreet Mr. Barlow, by taking with them the carpenter and the blacksmith and the rest of the useful members of society. But the village-community as it actually exists in India, or Servia, or anywhere else, only forms the substratum of society, on the top of which appear other social elements whose development it is not so easy to trace with certainty. The "gentleman," with his claims to live in a better house than the others whose business is to drudge for him, seemed absurd to Dr. Aikin's political economy, yet he makes his appearance in the Hindu village-community as elsewhere. Sir John Phear seems disposed partly to account for what may be called the landholding class, as well as the endowed priesthood, as having held a privileged position from the first settlement of the villages, and it is in favour of this view that in such settlements the founder's kin naturally have superior rights over the land to new-comers. But he does not the less insist on another and yet stronger social process which has tended to give to individuals a landlord-right over fields they do not till. When quarrels between two villages end in actual war, the conquering warriors (whose claims however seem to be here somewhat confused with the rights of the chief's family) would be rewarded for their prowess by grants of land carved out of the common lands of the conquered village, and the new lords being absentees would naturally put in tenants who would pay in return a share of the crops. Such metayage, or farming "on shares," is as common in India as in the south of Europe, and is evidently the stage out of which arose our rent-system of landlord and tenant.

One great value of books like the present is in showing the analogies and differences of social institutions which have much of their history in common with our own, but have developed under other conditions. Feudal lordship and feudal sovereignty have in the East overridden the old village-system in ways curiously like those of the West. Thus, as Sir John Phear says, the English manor was the feudal form of the Oriental village; the Bengal zamindar collects rents from his ryots and pays to the superior holder, or the Crown, living on the difference. Singhalese villagers may do suit and service either to a feudal chieftain or a Buddhist monastery, much as in England the fief might have been held either by a fighting baron or a praying abbot. It is interesting to find in Ceylon the notion that the existing tenure of land comes from the king having granted it subject to service, whereas its real history seems just the opposite, that the village-community came first, which the sovereign made himself paramount over and levied land-tax from. This reminds us of the theory of English law, that a cottager pastures his donkey on the common by sufferance of the lord of the manor, whose waste it is; the fact being that the peasant is exercising a relic of his old village-rights which has escaped the usurpation of the feudal system, and outlived it.

Though the village-community is much broken down in the districts so well described by Sir John Phear, it still shows the old framework in the division of the tilled land in allotments to each ryot, and the equitable settlement of rights and duties by the *mandal* or headman and his *panchayat* or village-council, which is one of the most admirable features of the ancient patriarchal system. But on the whole the village commune here shows practical results by no means admirable, and the husbandman's life on the roadless mud-flats of Bengal, minutely drawn by the author in all its details of dreary poverty and ignorance and hatred of improvement, is about as depressing a social picture as can be met with.

EDWARD B. TYLOR

NILE GLEANINGS

Nile Gleanings. By Villiers Stuart of Dromana, M.P. (London: John Murray, 1879.)

THE land of Egypt has of late caused the issue of a multitude of books, and that in consequence of the increased knowledge which half a century of Egyptian research has produced. Classical authorities no longer avail the traveller; he requires translations from the original hieroglyphic inscriptions, an insight into the discovery of a new world of antiquity and an acquaintance with the recent excavations which have revealed to the eye of the traveller an unveiled city of the dead. Scriptural texts alone garnished the older voyages. Above all the accomplished traveller should be acquainted with the various sciences which enable him to detect what is new or salient in the country that he visits, and its development, political institutions, progress, or decay should be seen at a glance even if it demands pages to describe them. The grand Egyptian tour is however a promenade of the land of monuments. Mr. Villiers Stuart's "Nile Gleanings" follow the usual track, and offer to the archæologist, besides the usual discussions on art, hieroglyphs, and language, and an occasional notice on the fauna and flora of Egypt, several new facts of archæological interest. At the description of Meidoum, the period of which is now known to be that of Senofrou, the tomb of Nofre Maat, with its strange figures inlaid with incrustations of red ochre, is new and interesting for its peculiar art and its remote age of the third dynasty; nor less important is the discovery of the flint flakes, the *débris* of the old chisels which sculptured it. Other tombs at the spot were remarkable for their gigantic masonry. These belong indeed to the more recent discoveries, but the traveller paid his respects to the dog mummy pits at Bebe, and the sites of Minieh and Dayr-el-Nakel. Considerable interest attaches to the heretical worshippers of the sun's disk, who flourished about the close of the eighteenth dynasty, and who endeavoured to remove the capital of Egypt from Thebes with "its hundred gates," to Tel-el-Amarna or Psinaula. The idea fashionable amongst Egyptologists has been that Amenophis III. of that line, the king, one of whose statues is the celebrated vocal Memnon, commenced an attempted religious reform and tried to substitute the worship of the sun's disk or orb, the Aten as it is called, for that of the god Amen-Ra, or the hidden sun. To this it is supposed that he was invited by the undue influence of his wife, Tai or Taiti. After his death it is conjectured that he was succeeded by his brother, Amenophis IV., and that this Amenophis IV. was a convert of the most pronounced zeal for the worship of the solar orb or pure Sabæanism. For this purpose, from the Amenhept, or the Peaceful Amen, he changed his name to Khuenaten, the Light or Spirit of the Sun. The chief data for this arrangement of the monarchs of the period of the eighteenth dynasty were the stones used for the construction of the Pylon or gateway of Haremhebi or Horus of the same dynasty, which were found to have been taken from an edifice of the so-called disk worshippers at Thebes, and built with their faces inside the wall, exhibiting the erasure of the name of Amenophis IV. and the substitution of Khuenaten in the cartouches for Amenophis. Some objections indeed might have been taken from the fact that the features of Amenophis and Khuenaten were different, it being of course facile to adopt a new faith, impossible to secure fresh features, even such unenviable ones as those of Khuenaten. Mr. Villiers Stuart discovered a new tomb at Thebes, with Amenophis IV. and his queen on one side of the door and Khuenaten with his queen on the other, both dissimilar in features, arrangement, and condition—one perfect, the other mutilated. As both sovereigns could hardly have occupied the same sepulchre, evidently one of the two appropriated the construction of his predecessor. The theory of Mr. Villiers Stuart is that Khuenaten was a foreigner, which has been always asserted, although it is more difficult to decide to which of the races of mankind he belonged; there are however some reasons to believe that after all he may come from Nubia or the South. The discovery of this tomb is in fact the principal new point of the work, and is the one new and important contribution to the obscure history of the heretical division which took place about the thirteenth century B.C.

The various sites of Esneh, Dendera, Assouan, Philæ, and the Nubian temples are well known, but are described in a light and graceful way, and much old material reproduced in a polished and not pedantic form. Necessarily a great deal is already well known to the student, and no inconsiderable portion to the general public. As to chronology the numerous systems and theories which have been started, amounting in all to above 200, allow any choice which suits best the proclivities of the inquirer. The present work has a new date for Rameses II., and throws his reign back to B.C. 1567, but it is difficult if not impossible to reconcile a period so exalted with the ceiling of the so-called Memnonium and the date of the heliacal rising of the dog-star on the calendar of Thothmes III. at Elephantine. Every fact connected with the Exodus is a subject of continual dispute, dates, line of march, names of the Pharaohs, place of the House of Bondage whence the Jews swarmed out. The only safe view to take is that the problem is insoluble, and that its resolution should be tied up with the sheaf of paradoxes collected by De Morgan. Mr. Villiers Stuart found the cultivation of sugar prosperous, by means, though, of that apology for slavery "forced labour," and he is indignant at the sufferings of the unhappy fellaheen, as also at the urgent scheme of taxation and the system of baksheesh and official bribery which pervades the modern as extensively as it did the ancient land of bondage; but *corvées*, it appears, are necessary for the payment of Daira bonds, and "the drachm," as in the Roman times, must be wrung out of the hard hands of peasants. While however glancing at the modern state of Egypt the interest of the writer is concentrated on the Egypt of the past, Pharaohs, their queens and their princesses, and a fair popular account is given of Thebes. His weakness is a love of dabbling in etymology, and venturing out of his depth on general questions of comparative philology. Although, for example, an occasional word may resemble its Greek or Latin equivalent, the construction of the hieroglyphic or old Egyptian and the Coptic is totally different from those two classical tongues, the Egyptian having a closer resemblance to the Semitic than the Aryan or Indo-Germanic languages. As to the Etruscan, the few known facts about its construction point to the Turanian or Tartaric family rather than the Egyptian. The origin of the Egyptians is still involved in obscurity, and belongs to the province of conjectural ethnology. More Caucasian in the north and at the earliest period, more Nigritic on the south and at a later epoch, the Egyptians seem historically a mixed race, a fusion of conterminous races of Northern Africa, and Eastern foreigners, and Nigritic blood. The oldest inhabitants still remain a mystery. One theory is that the Egyptian was the primitive man of a vast continent, the last representative being the aboriginal Australian. Amongst other interesting points are visits to the Dervishes, especially the fortune-tellers, and a description of the ride of the Sheikh of the Saidieh over the bodies of living men, who must have suggested to the apostle, had he seen him, the subject of Death on the Pale Horse. Like the car of Juggernaut, the Sheikh of the Saidieh is said to have been abolished. The ceremony might have been the relic of an old Egyptian one, and Pharaoh riding over his prostrate enemies may have anticipated the Sheik of the Saidieh. Altogether the work is entertaining and amusing; it is not so dry as a guide or handbook, nor so learned as an Egyptological history such as that of Brugsch-Bey, nor so elaborate as Wilkinson's Manners and Customs, and Topography, or other travels by professed Egyptologists; but its style is light and sparkling, and the principal details of history, mythology, and archæology have been fairly mastered. In the minute details of philology it is weak, but they do not affect the general reader, and are easily set right *en passant* by the expert. They will do no harm to scientific research, and they will amuse and to some extent instruct the public. The plates are also fairly done, and their colouring renders them more than usually attractive. It is decidedly agreeable to while away the monotony of a voyage down the river of the desert, as the Nile may be justly styled, and to those whose only travels are round their room, it will convey some pleasing impressions of what a visit to Egypt might show them.

LETTERS TO THE EDITOR

[The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.

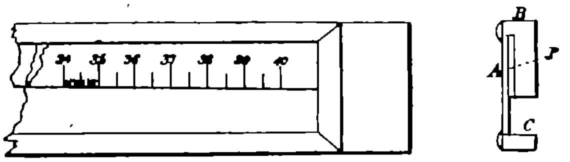
[The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.]

Improved Arrangement of Scale for Reflecting Instruments

THE inconvenience resulting from the position of the scale in the ordinary well-known form of Thomson's reflecting galvanometer must have been experienced by all who have had occasion to use it much, and especially by myoptic individuals. This I have been able to eliminate very easily, as hereafter described, so that there is no further craning over to see 'the spot," or getting in one's "light" in so doing.

The scale is mounted as shown in the sketch, which gives a front view of one end of the scale and a cross-section of the same.

B is a wooden scale-board with longitudinal slot, as shown at C; P is the paper scale, cut so that all the division lines reach the inferior edge; A is a slip of plane glass, finely ground as to its lower half on the side towards C, from one end of the slip to the other; the scale is so placed that the lower end of the division lines just touches the ground part of the glass slip. The image of the slit with a fine wire stretched across it is focussed in the ordinary manner on the ground part of the glass, and will of course be clearly seen by the observer on the opposite side of the scale; as the line and printed divisions are in the same plane, there is no parallax; and a great increase in accuracy of reading the position of the hair line is obtained, owing to the greater ease of observing that two lines coincide when end on to one another than when superimposed; and further, from the circumstance that the room need not be darkened.



This arrangement has been introduced at the beginning of this year by me in the testing-room of Messrs. Siemens Brothers and Co. at Woolwich, and has been most readily accepted by all my assistants, and I venture to say that any who adopt this arrangement will never return to the previous form.

I may state that I place the lamp and its slit on one side and reflect the beam of light on to the galvanometer by a mirror or total reflection prism, and further by means of two long plane mirrors reduce the actual distance between the galvanometer and scale, so as to have everything close to the observer's hand. The scale I have adopted is divided into half millimetres, and it is perfectly easy to read to a quarter of a division, and with a hand magnifying-glass still further.

This method is of course applicable to any physical instruments which are read by a reflected spot, and as there are no "patent rights" it is placed at the disposal of all.

Charlton F. JACOB

A Note on Flame-Length

THREE years ago, whilst endeavouring to make use of flame-length as a means of testing the economic values of different qualities of coal-gas by the determination of their specific flame-lengths, I was led to the discovery of some simple relations, the further study of which will perhaps one day help to simplify the theory of flames. By specific flame-length I mean the length of flame of a combustible gas burning in a normal atmosphere at a standard rate through a simple circular orifice under such conditions as to produce a symmetrical, vertical, steady flame capable of being measured. These conditions are not difficult to obtain in the case of coal gas. In fact for a very long time a flame-length test has been in use amongst gas-makers, but as the comparison has not always been made on the basis of volume the results have not always been satisfactory. The system I advocated was that of stating the flame-length for some standard rate. It occurred to me at that time that the flame-length should be proportional to the consumption or rate of issue of the gas. On submitting this theory to experiment I obtained satisfactory evidence that such was the case, as the following table taken at chance from a series of experiments will show:—

Flame-length. Inches.	Rate of consumption per hour. Cubic feet.	Calculated rate for 10" flame. Cubic feet.
2	·75	3·75
3	1·13	3·77
4	1·5	3·75
5	1·85	3·70
6	2·25	3·75
7	2·6	3·71
8	2·98	3·72

I have therefore formulated the following laws:—

1. That the flame-length of a combustible gas is proportional to the consumption.

2. That the flame-length is the distance travelled by a gas in obtaining oxygen for its consumption.

3. That the flame-lengths of different gases are proportional to the relative amounts of oxygen required for their combustion.

The last remains to be proved, and I have been led to experiment upon simple gases such as hydrogen, carbonic oxide, and sulphuretted hydrogen, with the object of determining their specific flame-lengths; but these gases give flames offering great difficulties in measurement. The flames given by coal-gas under suitable and easily-obtained conditions offer no difficulty, but I have not been able at present (owing to the difficulty mentioned above) to obtain very satisfactory results with the above-mentioned three simple gases. Other simple gases have suggested themselves, but the cost of preparing them in a state of purity in sufficient quantity has at present prevented their use. However, with regard to sulphuretted hydrogen and carbonic oxide, I have found their flame-lengths stand in the relation of 3·2 to 1.

In view of the difficulty of measuring the flames of these simple gases I am about to effect the determination by indirect means. By preparing mixtures of known composition that will give easily-measurable flames, I hope to be able to throw some light upon this subject of flame-lengths.

March 22 LEWIS T. WRIGHT

Future Development of Electrical Appliances

As many of your readers have doubtless read Prof. Perry's interesting paper on the future development of electrical appliances, a remark on one or two points might not be out of place. In speaking of the application of electricity to railway travelling, Prof. Perry says that the weight of the train would be much reduced under the proposed conditions, and rail friction would be minimised. It strikes us that to have light trains would not be altogether an advantage, for several reasons. The lighter the train the less profitable would be the *vis viva* against a strong wind (and the latter is an important element in railway locomotion). Again, the stability of a heavy carriage is much greater than that of a light one, and a heavy engine in front of the train must steady the whole system. It would be interesting to ascertain from a practical engineer whether a train of six coaches with self-propelling powers could safely run at a speed of fifty-eight miles an hour. GEORGE RAYLEIGH VICARS

Woodville House, Rugby

Prehistoric Europe

I AM sorry to have to ask you again to allow me to correct some statements made by Prof. Dawkins in the matter of the Victoria Cave explorations (NATURE, vol. xxiii. p. 482).

1. He says that "the antiquity of man in the Victoria Cave is solely due to the *perfervidum ingenium* of Mr. Tiddeman. It was first based on a fragment of fibula which ultimately turned out to belong to a bear. Then it was shifted to the cuts on two small bones." It is not, I believe, usual in the arena to hand over your own broken disabled weapon to your adversary to defend himself with when you take a new one. Yet this appears to be one of Prof. Dawkins's tactics. Who, reading the above remark, would believe that Prof. Dawkins ever held the following opinion? "Although the fragment [of the fibula] is very small, its comparison with the abnormal specimen in Prof. Busk's possession removes all doubt from my mind as to its having belonged to a man who was contemporary with the cave-hyena and the other Pleistocene animals found in the Cave" ("Cave-Hunting," p. 120.)

So far from the evidence having been "shifted" to the two small bones, on the breaking down of the fibula evidence, the latter event happened in 1878, whereas attention was called to the former in the Reports for 1875-6, the respective years of their discovery.

2. "The bones are recent," says Prof. Dawkins. "This is evidently a very old bone," said Prof. Busk, after inspecting and experimenting on one of them submitted to him; and the whole of the circumstances of its discovery confirm that opinion.

3. "The cuts have been probably made by a metallic edge." That is a mere opinion, and to show what it is worth I may remark that at the discussion at the Anthropological Institute in 1877, when Prof. Dawkins stated that the marks looked as if they had been made with a Sheffield whittle, another member, at least equally distinguished, and apparently equally desirous to oppose the evidence, said that the marks seemed to have been made by a rock slipping across the bones.

4. Prof. Dawkins states that there were frequent slips of the materials after I took charge of the work. He has, I think, been misinformed, for his own visits to the Cave during that period were not sufficiently frequent to warrant any such statement, and our endeavour was to work the Cave in such a method as would entirely prevent the possibility of such accidents and the mixture of the remains.

5. Prof. Dawkins goes on to show:—(1) Either that Dr. Geikie and I believe that "there is evidence of inter-glacial or pre-glacial man, possessed of domestic animals, and probably using edged tools of metals" (which we certainly do not); or that (2) in his opinion goat has never existed anywhere save as a domesticated animal, for his remarks proceed upon one or other of these two assumptions.

6. Bones of goat were far from uncommon in the hyena-bed of the Cave, and found under such circumstances as would render their slipping down from higher beds quite impossible. The same is the experience of that distinguished explorer, M. E. Dupont, Director of the Geological Survey of Belgium, in the caves of that country:—"J'en maintiens absolument la co-existence avec ces espèces perdues" (*Journ.* Anthropol. Inst., vol. vii. No. 2, p. 168). Unfortunately the non-existence of goats in Pleistocene deposits in Great Britain has been elevated to a dogma, and when the animals are found in such association it is immediately assumed that they have slipped from above—a confession to a very slipshod method of working—or, that the beds have previously been disturbed. All such cases should be most carefully inquired into and observed at the time without prejudice.

7. Again, Prof. Dawkins says that I wrote that the fact of the finding of reindeer with the earlier Pleistocene animals was "noteworthy," and that it is now too late to recall it. I do not recall my statement, but I should like it quoted correctly. "Your reporter had an impression that the reindeer remains occurred at some height above the hyena-bed.[1] Be that as it may, Prof. Dawkins's opinion[2] is entitled to great weight, and is indeed the view generally held. At the same time, considering that hyena and reindeer are not uncommonly found together in caves, when, as in this case, we see them mixed together at one or both ends of a section, but separated through an interval of seventy feet in length by a thickness of deposits, we may regard the fact as at least an interesting one, and, when found, noteworthy" (Brit. Assoc. Reports, 1876, p. 118). Prof. Dawkins shall have the whole of that. I will not recall even the middle sentence. R. H. TIDDEMAN

Hastings, March 26

---

[1] This was also the opinion of Mr. Jackson, our painstaking superintendent, who was daily at the Cave.

[2] *i.e.*, of the co-existence of these animals.

Induction Current from Leyden-jar Discharge

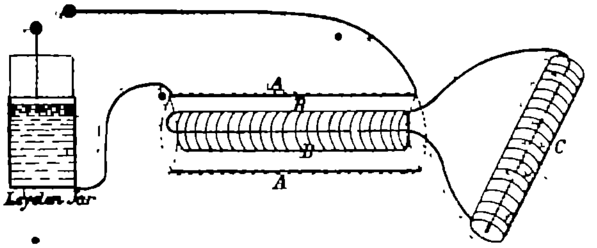
I WAS led to try the following simple experiments with the current induced from Leyden jar discharge, from the knowledge of what is the case in the Ruhmkorf's coil induced currents.

I have since found the experiments have often been tried before; but all may not be aware how simply and easily the results are shown.

After trying flat coils I found it more convenient to coil stout insulated wire round glass tubes. A few yards of stout wire round a tube A one foot long and 1¼ inches diameter gave me my primary coil; a similar tube B of less diameter to put inside A formed my secondary; and a third coil C enabled me to examine the current induced in B, with respect to its magnetising power, at a distance, away from the influence of the primary A. An electrical machine, a Leyden jar or two, a number of unmagnetised knitting-needles marked with paper at one end, and a compass-needle to test polarity, are also required.

The experiments are as follows:—

(1) With coil A alone show that a needle is magnetised according to Ampère's law; if we regard the direction of current to be from the + coat of the jar to the − coat.



(2) Now arrange the coils as shown, A as primary, B as secondary, C in the circuit of B, and a needle in C. Let there be *no* break in the circuit of B and C.

Then the magnetism induced in knitting-needle shows by (1) an action as of a current *inverse* to that in A.

(3) Now interpose a break in circuit of B and C, so that induced current gives a spark. We now get the needle oppositely magnetised, showing a direct induced current; and the magnetisation is *far stronger* than in (2).

This points to the two opposite induced currents both passing when there is no air-break; and the inverse having the strongest magnetising action; but the result weak. An air-break stops the inverse current, and the far greater effect of the direct current un-neutralised by the inverse is very marked; it can easily be shown to a class, for example.

I may add that I have been unable to try what results one gets with galvanometers from lack of instruments.

Cheltenham W. LARDEN

Classification of the Indo-Chinese and Oceanic Races

IT is surprising that Mr. Murton should have had any difficulty about the characters used by me to indicate the word *Papûwah*. The form in question is identical with his own, the apparent difference being due to the two different characters respectively employed by us to express the labial *p*. In the Arabic alphabet there is no sign for this letter, because the sound does not occur in the Arabic phonetic system. Hence other Muhammadan nations using the Arabic alphabet supply the missing letter in various ways, the Persians, Afghans, and Indians by the form پ, the Malays usually by ڤ. Hence the two apparently different but really identical forms and which have puzzled Mr. Murton and his Malays of Singapore.

A. H. KEANE

Crabs and Actinia

THE account of the actinia on the claws of a crab in your last number (p. 515) is of interest as raising the point as to what benefit the crab derives from its friends. In the *Annals of Natural History*, many years ago, I wrote that, having for a long period kept *Adamsia palliata* with *P. Prideauxii* in confinement, I had no doubt but that the white tentacles of the anemone were a bait which attracted various small animals within reach of the crab's claws, though it did not, as Möbius seems to think, in any way aid the crab in capturing its prey.

In the South Sea Islands I saw a splendid specimen of a crab carrying a large actinia. The habit of the crab was to conceal itself entirely in the sand, leaving the actinia waving its tentacles on the surface. No sooner however did a small crab, annelid, or other creature come within reach than the crab, shooting its claw out of its concealment in the sand, struck out, and in most cases captured it. Here there was no doubt of the use of the actinia as a decoy. H. STUART WORTLEY

Patent Office Museum, South Kensington, W., April 4

Migration of the Wagtail

WITH reference to the statement of Herr Adolf Ebeling (*apud* the correspondence from the New York *Evening Post*, quoted in your issue of February 24, vol. xxiii. p. 387), that the fact that wagtails in their wintering "came to Africa, and especially to Nubia and Abyssinia, was then unknown to us," permit the remark that as "*then*" must refer to a date not earlier than 1850 (when Heuglin went to Egypt), the appearance of wagtails on the west coast of Africa, as far south as Cape Verd, had been observed more than half a century before

In the *Annales de Chimie* for July, 1793, M. Prélong, one of the lieutenants of Stanislas, Chevalier de Boufflers, and director of the hospital at Gorée, records the arrival on September 14, 1788, of a flight of *bergeronnettes* from the north. In connection with this M. Prélong remembered that Adanson had seen swallows at Senegal October 9, 1750 (?), while he himself could testify to their leaving his native *pays* (the Hautes-Alpes) towards the end of September. Prélong took ship for home in the middle of May, 1789, and was accompanied by his feathered friends the wagtails. N. J.

New York, March 15

Sound of the Aurora

UPON this subject it may not be out of place to recall the fact that the passage of large meteors is not uncommonly described as accompanied by a hissing sound. I have met with statements of this kind in the case of meteors which were proved to have been twenty, thirty, or forty miles distant from the observer, and the sound of which, therefore, if it had reached him at all, must have reached him after such an interval of time that he would have been very unlikely to connect the two phenomena. Moreover the sound described in these cases is of a totally different character from the true sound of meteors, which is spoken of by those who have heard it as a heavy roaring or rumbling sound.

The explanation of the alleged "hissing" is not difficult when we remember that the untrained observer of a bright meteor (although it may be distant fifty or a hundred miles from him) invariably regards it as a near object, falling, it may be, into the next field, or behind a neighbouring hill. Regarding it in this light, he attributes to it, by a well-known mental process, a sound such as a firework at the same distance might be expected to produce.

May not the "rustling" of the aurora be equally a subjective phenomenon? GEORGE F. BURDER

Earthquake Warnings

IN *Comptes rendus*, lxxxi. October, 1875, I find it stated, on the authority of M. Rivet, Telegraph Superintendent at Fort de France, Martinique, that when that island was visited by repeated earthquake shocks in September, 1875, each shock was preceded by a very marked disturbance of the electric telegraph needles. M. Rivet suggested that in this way warnings otherwise unattainable of impending shocks might be obtained.

It would be interesting to learn whether this observation has been confirmed by recent experience on the Continent.

Such warnings might often be the means of averting loss of life and property, and in cases like that at Ischia would, by their occurrence or non-occurrence, afford some additional clue to the real nature of the forces at work. H. M. C.

Charlton, March 31

ON THE EARTHQUAKES AT AGRAM IN 1880-81

[At our request Prof. Szabo, Professor of Geology and Mineralogy in the University of Budapest, has prepared for the pages of NATURE the following account of the recent earthquakes at Agram. This account is a thoroughly reliable one, as it is drawn up from information obtained from Dr. von Hantken, the Director of the Hungarian Geological Survey, and Mr. Schafarrik (Prof. Szabo's assistant), both of whom were officially deputed to visit the district and inquire into the whole of the facts.]

On November 9, 1880, at 7h. 33m. 53s., a very violent earthquake passed over the south-western quarter of Hungary and also Bosnia and Herzegovina. The limits of this large territory are approximately as follows:—West, the peninsula of Istria and the town of Trieste; north, Vienna and Gödöllö (north-east from Budapest); east, the flat lands between the Danube and the Theiss; and south it reached far beyond Serajewo, because the earthquake was felt in this town also very strongly. It is said by some that the earthquake was even observed in Budweis (in Bohemia) and in Debreczen (east-north-east from Budapest). This territory is approximately equal to a circle, the radius of which is forty geographical miles long, and therefore its area is nearly 5000 square miles. From all information received up to the present time it may be asserted that the earthquake was not equally felt over the whole territory, but mostly in the centre of the circle—in the environs of Agram, where the damage occasioned was considerable.

According to the testimony of trusty witnesses the earthquake began on the day mentioned above with a strong shock in an upward direction, which was accompanied simultaneously with a perceptible and loud subterranean noise; this was followed by a subsidence; then came a perpendicular shock from below; and lastly came an oscillatory movement of the earth in an east-south-east to west-north-west-direction. This movement, which lasted nearly ten seconds, was so intense that in the town of Agram not only all the larger public buildings, but with few exceptions every dwelling-house, was damaged more or less.

One peculiarity of this first shock is that not only were objects of small weight removed out of their original positions, and this was especially the case with objects standing on a flat surface, but it also produced a certain rotatory motion upon them (contrary to the hand of a watch); even some trustworthy witnesses affirm that the first shock had a rotatory effect on them.

Chimneys are the objects which are the most easily damaged by earthquakes, and so in Agram there was [illegible]ly a chimney to be seen after the earthquake which had not been either cracked or entirely ruined. The number of fallen chimneys amounts to nearly a thousand. An enormous amount of damage was also done to the roofs of houses; one could see from the roof-tiles placed on laths that they had been shaken by the oscillation, and were partially broken and fallen down, especially those which were situated towards the east or west. All this happened in the morning when the streets were mostly crowded with people, and one must be astonished indeed that the great quantity of falling masonry, parts of walls, stone cornices, huge beams of wood, and pieces of broken glasses, &c., did not hurt more people; altogether only twelve were severely wounded (broken arms, hands, feet, head wounds, &c.), but only in two cases did the injuries prove fatal; about twenty suffered slight contusions. In the surrounding country three men died, and some suffered from various injuries.

Among the public buildings and the larger dwelling-houses in Agram not one has actually fallen to ruin, but the number of those houses, whose outward walls were obliged to be supported by long beams on every side, is considerable; much more terrible, however, is the view of destruction inside the buildings; the mortar from the walls of the rooms is for the greatest part fallen down, and the thinner walls have been shaken so much that some of them are totally fallen to ruin. About twelve buildings were so ruined by the earthquake that it was necessary to forbid their reconstruction, and the Senate of the town found itself compelled to order their entire demolition. Here is the corner house belonging to Mr. Priester, with two storeys facing the Marie-Valerie Street and Jellacsics Square, whose western frontal wall has separated itself from the other parts of the house, and is entirely bent towards the Marie-Valerie Street; the house of Mrs. Zorgách in the Petrijani Street is ruined and must be demolished; the building of the Military Academy in Ujlak has been a real and sad ruin. In the upper part of the town the following edifices are designated to be demolished:—Br. Ozegovich's house, the Mednyanszka Barracks, a certain part of the military "General-Commando" building, &c. The number of those buildings which have been rendered uninhabitable by the earthquake is great, but with great difficulty—by using iron braces—they can be renewed. To these buildings belong the cathedral, which is erected in the broad square courtyard of the archbishop's palace. In this cathedral the vault of the sanctuary has fallen in and has covered the high altar and the space before it with fragments of wall and rubbish; further, a part of the vault just before the organ and a little to the right of the entrance has fallen down in the centre nave; in the side nave a very heavy horizontally-placed buttress split, fell down, and broke through the tombs where the coffin of a canon was; besides these more striking damages the main wall was split in several parts. The archbishop's palace itself has been damaged to such an extent that the archbishop and the canons were obliged to leave their apartments for a long time. In the same manner the Franciscan and St. Mark's Churches were also damaged. One can also add among the others St. Catharine's Church, which has been sadly damaged, as also the edifices of the University and of the "Realschule," and many other private houses. The high chimneys of the gas-factory and of Grator's brick-kiln were only partially damaged at the upper part.

After these come those houses which, though they were very greatly damaged, yet the people were not obliged to quit them; and lastly follows the great number of those buildings which sustained only smaller damages (for instance, little rifts near the windows or along the corners of the walls, through mortar, &c., falling down). The proportion between the number of the edifices which became uninhabitable and had to be demolished, in comparison with those which were damaged in a greater degree and those which were slightly damaged, is about 1 : 1 : 4. This arithmetical proportion nevertheless cannot at all express the damage that happened, because among the two first categories are the most valuable buildings, viz. the churches, barracks, the largest and newest houses, while the mass of the third category consists of small low buildings; one must attend to the above descriptions because it is impossible to set strict bounds between the single categories, for there were many houses whose ground-floors were totally free from chinks, the first- and second-floors already showed gradually more chinks in the walls, while the third-floor presented a terrible picture of destruction. The damage to edifices caused by earthquakes depends on their solidity, on their height, and on their situation. As regards the solidity, they found that the weaker the walls were, and where iron braces were not applied, the more were the buildings damaged; as regards the height, on the occasion of this earthquake it was observed that the second-floor was more damaged than the first, and the third more than the second; and finally as to the situation, there are some remarkable examples, houses forming south-east and north-west corners were exceedingly damaged, viz. south-east was the direction where the first shock came from.

In the environs of Agram the earthquake appeared with no less strength than in the town itself, but the damage to the surrounding country is not so general, because here are the peasants' cottages all built of wood. Here therefore only the churches, the parsons' houses, schools, castles, and gentlemen's private houses were the objects on which the earthquake left visible marks.

All the buildings of any strength in the villages which are situated at the south-east slope of the mountain called Sleme, north from Agram, were damaged in a more or in a less degree; there is for instance the well-known place for pilgrimages, Remete (5 km. north of Agram), where the walls of the church, which is ornamented inwardly with very beautiful frescoes, and of the steeple are strongly gaped in all directions, while the vaulted roof of the nave is totally fallen down; so is also the residence of the parson; the damage caused in these two edifices amounts, according to an official valuation, to 38,000 florins. In Grancsina (7 km. north-east from Agram) the steeple, falling down in an easterly direction, broke through the roof and the vault of the church, so that now one can see only the four very ruptured walls. On the other side of the mountain Sleme, in a certain part of Croatia named Zagoria, many castles were ruined.

The circle, where the earthquake caused the heaviest losses has approximately the following bounds:—South-west, Karlstadt; west, Landstrass, Gurkfeld; north-north west, Rohitsch; north, Warasdin, Csáktornya; north-east, Kaproncza (Kopreinitz); east, Belovár; south-east, Sziszek, which corresponds to a territory of about 120 square miles; the centre of this circle was the place where the first shock emanated from. The data kept in the surrounding parts relative to the direction and the greatest intensity of the shock indicate the territory which lies to south-east from Agram, and forms the alluvium of the River Save as the starting-point of the whole phenomenon. Here the crevice in the earth appeared also, caused by the strongly-oscillated motion. A little to the east from the village of Resnik (east-south-east from Agram) was the crevice in the alluvium of the Save. It was 5 kilometres long, and had several interruptions, and extended in a south-east direction, from which here and there some smaller crevices radiated. This chief crevice, which continued through the Save as far as the village of Scitarjevo, showed in some places a few days after the earthquake openings one to two feet broad, but for the most part the crevice was filled with bluish alluvial sand, which was forced out, mixed with water by the opening and closing of the crevice being formed by the oscillation of the soil, the water forcing its way through this dense pulp, produced by its upheaval those small flat craters which many people are inclined to declare volcanoes of mud. The dimension of these small craters is very variable; their diameters differ between 2 and 75 c.m., their height 1 to 30 c.m.; and, calculating from these numbers the cubic contents of the largest flat cone, we receive nearly 0·5 cubic metres; this little quantity of the out-pressed material is enough to exclude the hypothesis that these cones were the result "of a slow action for some hours." If hydro-sulphuric gas was present during this phenomenon, as some believe, it is not known, because we want positive and trusty evidence on this point. Moreover it is not impossible that there should be an appearance of small quantities of hydrosulphuric gas dissolved in the water of an alluvial slimy soil, because such water generally contains decaying substances and finely-dispersed sulphates, but one can in no case suppose that a great quantity of hydrosulphuric gas would have produced the crevices and ejected the sand mixed with water.

Beyond this territory of 120 square miles the earthquake was felt with a gradually diminishing strength, and in many places the motion was so weak that a great many of the inhabitants did not remark it. Among these can be mentioned Fiume, where they felt only a very slight shock; then Budapest and Vienna, where only one or two became attentive to this phenomenon.

Beyond the territory of 120 square miles, where they suffered the strongest shocks, there are yet some environs, though far enough from the centre, where destruction also happened, for instance in Styria, and in Hungary, in the neighbourhood of Pécs (Fünfkirchen). To explain the connection of these cases with the entire phenomenon deeper researches must be made.

It remains to communicate shortly the statics of the earthquake.

1. November 9, at 7h. 33m. 53s. in the morning, the first shock enduring 10 seconds with a subterranean noise. This one has caused all the damage.

2. November 9, at 7h. 37m. in the morning: an oscillatory motion without a noise.

3. November 9, at 8h. 27m. 55s. in the morning: slight motion.

4. November 9, at 10h. 50m. in the evening: very slight motion.

5. November 10, at 6h. in the morning: very slight motion.

6. November 11, at 11h. 26m. in the forenoon: a strong oscillation, which effected some damage.

7. November 16, at 12h. 4m. in the morning: a sufficiently strong shock accompanied with a dull noise.

8. November 16, at 12h. 44m.
9. „ „ 12h. 49m.
10. „ „ 1h. 9m.
11. „ „ 4h. 24m.

in the morning: weak oscillations, of which only the last had a little more strength than the others.

So it lasted continually during December. Even in this year (1881) in January and February feeble shocks recurred after longer interruptions; the last shock was recorded in the newspapers from March 4

Budapest, March 18

THE ST. PETERSBURG DYNAMITE MINE

THE following account of the mine recently discovered in St. Petersburg, extracted from Russian sources, gives a remarkable picture of the state of society in the empire, where able chemists and expert miners can be found to engage in such desperate undertakings.

It appears from a sketch-plan which accompanied the translation put into our hands, that the mine extended from one side of Malaya Sadobaya Street to the centre of the roadway; the total length of the mine gallery ~~being~~ fifteen paces, the street must be thirty paces, say seventy-five feet wide.

The gallery terminated in a chamber about double its diameter, and in this was found the charge contained in a case twenty-two inches long and eight inches diameter, weighing sixty-five pounds, and beside this a glass jar contained about thirty pounds more of the explosive substance, apparently an excess quantity over that required for the actual explosion. The explosive consisted of a species of dynamite made by mixing nitro-glycerine with powdered charcoal. This is more powerful in its effects than the ordinary substance, in which an inert body, generally a soft infusorial earth, takes the place of the charcoal. The description of the fuse, as contained in the Russian account, is very obscure, but so far as can be made out it would appear to have consisted of a wide heavy glass tube containing an explosive, described some time back in NATURE, and prepared by mixing nitro-glycerine with about 10 per cent. of gun-cotton, the result being a very explosive substance of a partially gelatinous character. In the midst of this, and surrounded by a mixture of potassic chlorate and antimonious sulphide, was a sealed glass tube containing concentrated sulphuric acid and a leaden weight. The whole was then apparently connected with the dynamite in the case by means of an india-rubber tube also containing explosives. If this was the actual construction the *modus operandi* of the conspirators was very simple, for the heavy glass tube had only to be allowed to fall, when the lead would have broken the sulphuric acid tube, and the chlorate mixture would have at once inflamed, and the explosion of the jelly would have communicated by means of the rubber tube with the torpedo. At the same time it is very difficult to imagine the reasons which could have induced the conspirators to adopt so crude a method when, as it appears from the account, they had at their disposal in the room adjoining that from which the mine was driven no less than four galvanic batteries, with which the explosion could have easily been instantaneously effected by those on the watch for the passage of the intended victims, a method of operation much more consonant with the skilled character of the other parts of the work. It is however very difficult to understand a description such as this when derived from a non-scientific source, as may be imagined when one of our daily contemporaries stated that the fuse contained "*bartholley salts*," and another "chlorate of potash and *sulphide of ammonium*."

Whatever may have been the real mode intended to have been used by the conspirators, the results would have been sufficiently frightful, as it is probable that the charge found would have made a "crater" of about fifty feet in diameter.

The jelly contained in the glass tube was, when analysed, found to contain about 4 per cent. of camphor. This was added to render the mass less sensitive to any accidental shock which it might incur, and is an ingenious application of principles laid down by Abel (*Proc.* Roy. Soc. xxii. p. 163) in his well-known paper on "The History of Explosive Compounds," in which, though not actually mentioning the dilution of a liquid or semi-liquid explosive by the solution in it of another body, he clearly indicates the probable effects of such a treatment. That men of education and ability should so apply their undoubted powers must be a matter of regret to every student of science.

FISH-CULTURE IN THE UNITED STATES

IT is a common saying, that everything in America is on a larger scale than in this country. The longest rivers, the largest lakes, the highest mountains, the broadest plains, the most stupendous waterfalls, and the biggest hotels, are all to be found in the New World. Fortunes are made with a rapidity which is unparalleled in Europe; and men who only lately were penniless adventurers are losing or winning millions in New York. The latest example of the scale on which everything in America is conducted may be found in a volume of more than 1000 pages, printed in the Government printing-office, bound in the Government "bindery" of the United States, and containing the Annual Report of the United States Commission on Fish and Fisheries. The volume, it may be added, has been preceded by five others of almost equal length; and gives a remarkable idea of the importance which the Americans attach to fish-culture.

It would obviously be impossible to attempt, within the compass of a newspaper article, any adequate review of a work of this character. But we may perhaps indicate its nature by rapidly describing its contents. The volume, then, is roughly divisible into two parts. The first 64 pages contain the Report of the Commission; the last 988 pages are occupied with appendices and an index. Forty-four appendices of unequal importance are thus published. The greater portion of them consists of translations or reproductions of papers published in other countries and having more or less reference to the work of the Commission. For instance, there is a report by Herr Wallem (the well-known Norwegian Inspector of Fisheries) on the American Fsheries; by Prof. Sars on the Norwegian Deep-sea Expedition of 1878; by Mr. Stirling of Edinburgh on the Recent Outbreak of Salmon Disease; and by other authorities on various subjects. In addition the appendices contain original papers by Messrs. Livingston Stone, C. G. Atkins, and other American fish-culturists on matters more or less connected with fish-culture in the United States. Thus the volume undoubtedly contains a vast mass of information. Much of it indeed is written in a style which in this country would be considered more suitable to a review than to an official report. But the American system of government is so different from our own that an Englishman cannot easily form an impartial opinion on this point.

Herr Wallem estimates the yearly profit, by which we think he means the gross yield, of the fisheries of the United States at 27,300,000 dollars. In this sum is "naturally not included what foreign nations capture on the banks of America, nor what the fisheries of Canada yield. If one should take both these factors into the calculation the amount mentioned may perhaps be increased by one half, because the French fisheries alone on the Newfoundland Islands have a yearly profit of $1,365,000 to $1,638,000, and the Canadian fisheries yield $10,920,000 to $12,285,000 yearly." Herr Wallem adds in a note that "for comparison it may perhaps be instructive to state that the Norwegian Marine Fisheries may be estimated at $12,285,000 to $13,650,000 yearly, and the French at $15,015,000 to $16,380,000." If these figures may be accepted as correct on the high authority of Herr Wallem, the American fisheries must be worth about 5,500,000*l.* a year; the French fisheries 3,250,000*l.*; the Norwegian fisheries 2,600,000*l.*; and the Canadian fisheries 2,250,000*l.* We have unfortunately no statistics at our command which would enable us to compare these values with the produce of our own fisheries, but we do not believe that any competent authority would place their value at less than 6,300,000*l.*; and we believe that most persons would be disposed to name a higher sum. Englishmen, therefore, may have the satisfaction of reflecting that the fisheries of the British Islands are still the most important in the world; though the fishermen of the United States are fast overtaking British fishermen.

Those persons who are most familiar with the British fisheries are aware that for years past complaints have been made of the injury done both to fish and fishermen by the operations of trawling. It is very singular that trawling is also objected to in the United States; and the Commissioners print in their appendices a petition from the fishermen of Block Island on the subject. But the similarity between the complaints disappears on examination. A trawl in England is a large purse-net, attached to a heavy beam raised upon trawl heads or irons at either end, and dragged along the bottom of the sea. A trawl in Scotland is simply a draft or seine-net; a trawl in America is a long line baited with hooks and left on the bottom of the sea. It is very odd that these three distinct modes of fishing are all objected to in the different countries in which they are employed. In Scotland the drift-net fishermen object to the trawl or seine-nets; in England the drift-net fishermen and the line fishermen object to the beam trawls. In America the hand-line fishermen object to the set-line fishermen, whom they call trawlers. Among the fishermen of the three countries there is a cry against trawling, and the fishermen of the three countries are all alluding to distinct modes of fishing. These complaints may, centuries hence, puzzle some antiquarians, who may naturally assume that these races, speaking the same language, mean the same thing by the same word. They all are due to the jealousy usually felt by the introduction of new machinery in any industry. The set-line fishermen, who complain of the beam trawls in this country, form the very class which the hand-line fishermen complain of in America under the name of trawlers; and the Governments of both countries may safely disregard both complaints, since one of them is the most effective answer to the other.

We have reserved for the close of this article all reference to what the Commissioners would consider the most important portion of their Report. The Americans are the greatest fish-breeders in the world, and fish-breeding is conducted in the United States at a cost and to an extent of which in this country we can have little idea. According to the Report, the Commissioners distributed in 1878 no less than 15,700,000 shad and 4,460,000 Californian salmon, besides other fish. Such prodigious efforts will excite surprise among persons who are acquainted with the difficulties of obtaining even a few thousand ripe salmon eggs, and we naturally turn for information as to the results which have ensued from such unprecedented efforts. Here however we find, as it seems to us, the least satisfactory portion of the Report. The Commissioners claim indeed that no less than 500 salmon were taken in the mouth of the Connecticut River in 1878, a river which they imply had had few or no salmon in it for many years. It is possible therefore that the Commissioners' efforts may have been successful in restocking that river with salmon; though we own that we should feel more certain of this if the fish had been taken in the river itself, and not in the mouth of it. But when they go on to infer that they may increase the yield of shad, and even of herring and of cod, we read with admiration of their energy, but without being convinced by their reasoning. In this country, at any rate, the best observers are satisfied that cod, herring, and other fish are annually bred in numbers compared with which the fifteen millions of fry of the United States Commission would represent an insignificant fraction, and that the destruction which is going on among them by natural causes is so vast that even the capture of white bait by the ton-load makes no appreciable addition to it. The arguments which Malthus, at the commencement of the century, used to illustrate the principles of population are thought in this country to be strictly applicable to fish. Sea-fish, like all other animals, are undoubtedly increasing in greater proportion than their food; and it is obvious therefore that unless man can increase their food it is only lost labour to increase their number.

We have thus reviewed, at some length, a few of the leading facts in this long and interesting Report. With many of the conclusions in it we are unable to agree; but we cannot part from it without expressing a feeling of almost envy at the elaborate pains which the Government of the United States is taking to understand the best methods of developing the great industries of their seas. In this country we do not even take steps to obtain the best statistical information on the subject. Might we not in such a matter with advantage follow the example of our Transatlantic kinsmen?

THE PARIS OBSERVATORY[1]

ABOUT two years ago, Rear-Admiral Mouchez, director of the Paris Observatory, resolved to bring together for exhibition the instruments scattered in various parts, and by joining to that collection the portraits of great astronomers and methodically grouping all the documents relating to the history of astronomy which could be procured by bequest or otherwise, to lay the basis of a special museum of very great interest. This proposal, having received the approval of the Minister of Public Instruction, is now being realised. One of the large rooms on the first floor of the Observatory has already been fitted up and occupied, and through the kindness of Admiral Mouchez, who himself did us the honour of giving full details of his new collection, we are able to publish the description.

The first hall of the Astronomical Museum is very artistically decorated. It is circular in form, and well lighted by several windows. The ceiling will probably be adorned by a painting representing the transit of Venus over the Sun. There are nine paintings in the room, representing Louis XIV., founder of the Observatory, and directors and eminent astronomers who have succeeded each other to the present day: Cassini, Lalande, Delambre, Laplace, Bouvard, Arago, Delaunay, and Leverrier; the latter painted after death by Giacomotti, is the gift of M. Bischoffsheim. In the embrasures of the windows are displayed astronomical paintings representing groups of nebulæ, Saturn's rings, lunar volcanoes, clusters of stars, the remarkable drawings of Jupiter and Mars executed by MM. Henry, &c.

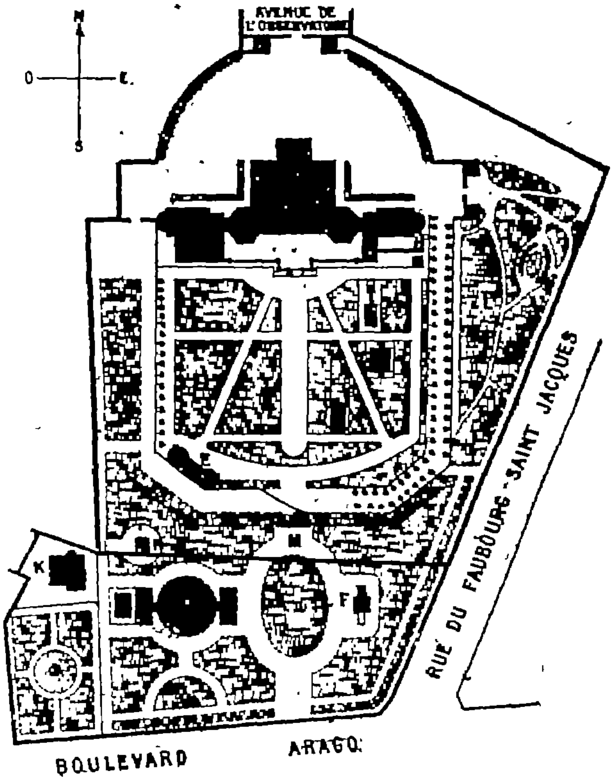


Fig. 1.—Plan of the Observatory, with the proposed extension on the south side to the Boulevard Arago. Present state: A, the Observatory [illegible] the "sidérostat;" C, the meridian circle; D, the great telescope; E, equatorials; M, ditch to be filled up; L L', ditches. Ground to be annexed: F, the Bischoffsheim equatorial; G, the great refractor of 0.74m. aperture; H, Fortin's circle, K, the astronomers' dwelling-house.

On the oak mantelpiece stands a magnificent Louis-Quatorze clock made by Coypel and recently restored by M. Passerat, a specimen of art so unique that virtuosos would certainly attach a great value to it. Round the room are observed several globes mounted on marble and oak pillars, two being especially worthy of attention: the celestial sphere of Gerard Mercator (1551), and the terrestrial sphere of the same geographer (1541). On the latter globe may be seen figured a certain number of the great lakes of Central Africa already known and their positions well indicated in the middle of the sixteenth century. These spheres, which constitute documents of great importance historically, were recently discovered at the Brussels library through a folio pamphlet bought in 1868, and have been reproduced with great accuracy, by M. Malou.

---

[1] From an article by M. Gaston Tissandier in *La Nature*, and M. Mouchez's official Report of 1880.

The objects exhibited are carefully classified in glass cases, so that they can be examined by the visitor without being touched. In the first case, which is set apart for optical instruments, is observed Fresnel's great lens; also some of the object-glasses made use of by Cassini, and other valuable objects presented to the Observatory by Mme. Laugier, such as the optical apparatus made use of by Arago; the photometer, prismatic mirrors, and the polarimeter, by means of which the great astronomer enriched science with so many beautiful discoveries.

The second case contains objects relating to the history of the "metric system," comprising a standard metre and several curious specimens of foreign measures. The other glass cases, arranged in a circle round the room, contain various astronomical instruments, among which we may mention the apparatus made use of by M. Cornu to measure the velocity of rays of light, a large theodolite of Rigaud, another of Bruner, one of the first sextants ever constructed; also several instruments of more modern date, the first portable meridian circle of M. Mouchez, Gambey's theodolite, &c.

The case in the centre of the room is especially noticeable: it contains a curious collection of German instruments of the sixteenth century, in perfect preservation. The attention is at once attracted by several instruments of gilt brass, most artistically carved, which were made at Nuremberg in the sixteenth century. Amongst them we observed a curious mechanical arrangement for casting dice, which was probably used for some demonstration of the doctrine of probability and chances; a valuable sun-dial of carved brass, dated 1578, full of groups of allegorical personages; a species of altazimuth; a handsome repeating-circle, highly ornamented, and bearing the two-headed eagle of Germany; some astrolabes, quadrants, mariner's-compasses, a small ivory sun-dial of the sixteenth century, presented by M. Eichens. The history of all these instruments except the last is unknown; but it is supposed that they were either presented to Louis XIV. or are what is left from the spoil of the First Empire having escaped the notice of the Allies in 1815.

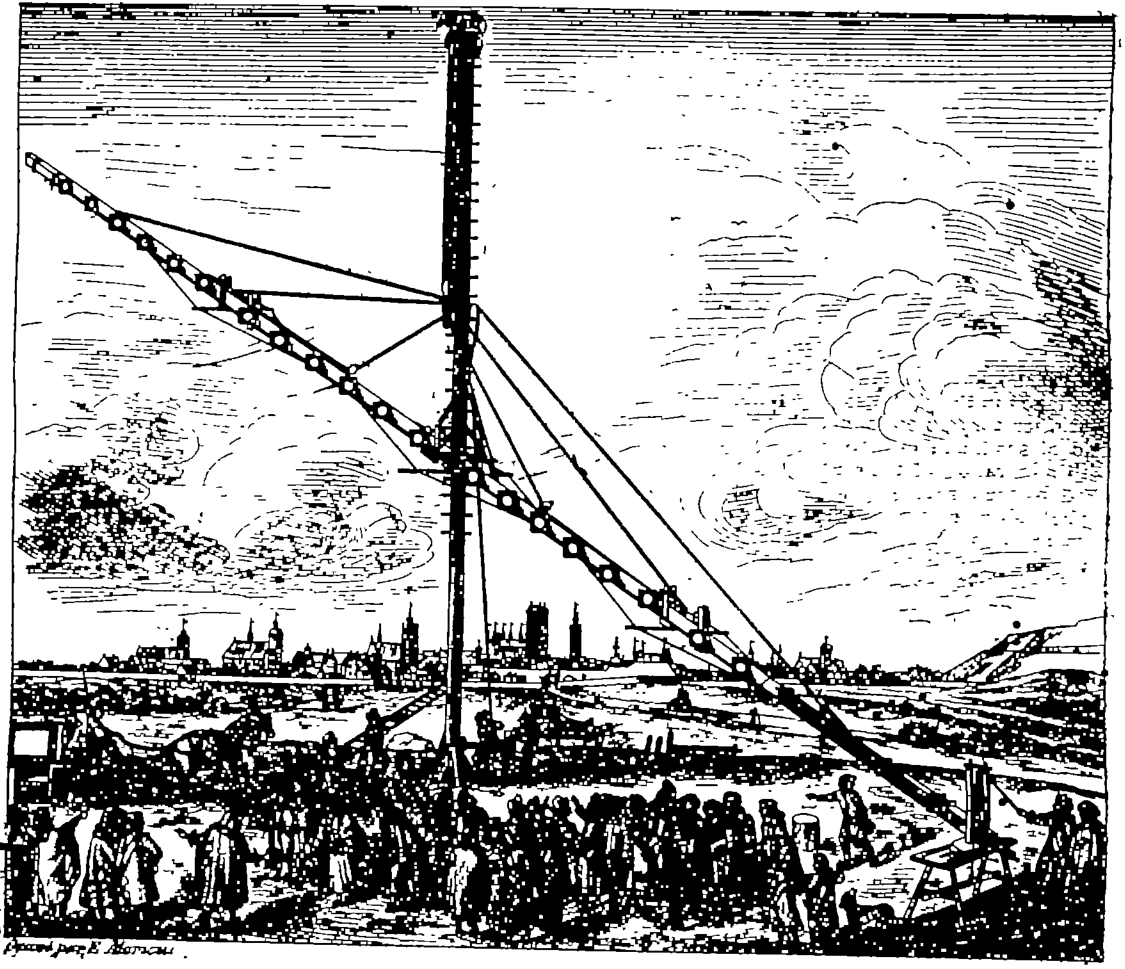

Fig. 2.—Aerial telescope of the seventeenth century, after Hevelius, from an engraving in the new Astronomical Museum of the Observatory of Paris.

On the lower part of this case are shown photographs of old engravings representing the astronomical instruments of former ages. One of those curious pictures is reproduced above (Fig. 2), showing the astronomical telescope with a simple object-glass of long focus which was constructed in the seventeenth century, and of which an engraving was published by Hevelius. It may serve to convey an idea of the singular and gigantic instruments which astronomers of bygone times made use of.

In a room on the floor above there is a special exhibition of a large number of photographs, which is being constantly increased by new additions. They consist of photographs of all the ancient instruments copied from engravings of the period; and all the foreign instruments in present use, taken from nature. There are also drawings representing the principal observatories in the world.

Such is the commencement of the astronomical museum of the Paris Observatory. It will be completed by organising a second circular room resembling that which we have just rapidly passed under review. This new room will be adorned with portraits of the most illustrious of foreign astronomers:—Newton, Galileo, Tycho-Brahe, Kepler, Copernicus, Herschel, Bradley, and others. It will also contain a special exhibition of large astronomical instruments; notably a quadrant of Lalande's, a sextant of Lacaille's, a quadrant of Langlois' which was used by the North Pole Committee, and a meridian telescope of Delambre.

It would be useful to bring together in the Paris Observatory those instruments which are scattered here and there in various other national institutions, so as to complete a collection already so rich in valuable objects. The directors will also gratefully accept of any bequests that may be addressed to them from private individuals, as was done by Mme. Laugier with reference to the instruments of Arago and Delambre which she had in her possession.

After our survey of the new Astronomical Museum, it now remains to say a few words regarding the extension of the observatory, which is about to be made by annexing the ground on the Boulevard Arago (Fig. 1). This waste land contains a superficies of at least 9000 metres, and when the ditch which at present divides it from the Observatory garden is filled up, it will be united to the rest of the institution without any separation. On these grounds will be erected the great ·75 m. telescope, the arrangements for which are already well advanced; also the equatorial presented by M. Bischoffsheim, the circle of Fortin, which long rendered excellent service, and was dismounted in 1862 to make room for the the great meridian-circle, and several instruments for the special use of the pupils.

The plan which we give above (Fig. 1), from official documents, shows what the Paris Observatory will be as a whole when the projected improvements are completed.

We regret that the works are being so slowly carried on, notwithstanding the praiseworthy energy evinced by the directors of the Observatory. A ditch to be filled in, a garden to be laid out, a few buildings to be erected, all amount to but very little. But before the masons cut a stone or the gardeners trace an alley there is a path to be traversed which is not exactly the shortest or quickest, viz. that of administrative and official routine.

ACHILLE DELESSE

WE regret to have to record the death of this eminent geologist, which took place, after a long illness, on March 24. Delesse was born at Metz, and was educated at the lyceum of that town, afterwards proceeding, at the age of twenty, to the École Polytechnique at Paris. He was a diligent and successful student, and in 1839 took his degree as a mining engineer. He then travelled for some time through his own country, in Germany, Poland, and the British Islands, and in 1845 was appointed Professor of Geology and Mineralogy at Besançon, where he also practised as a mining engineer. It was during his residence here that he wrote his "Notice sur les Charactères de l'Arkose dans les Vosges," and his "Mémoire sur la Constitution minéralogique et chimique des Roches de Vosges," both of which works appeared in 1847. After a stay of five years at Besançon Delesse returned to Paris, where he was employed as a mining engineer, and was especially engaged in superintending the quarrying operations about the city for nearly eighteen years. In 1855 he prepared the report on building materials in connection with the Exposition Universelle of that year in Paris. In 1864 he was nominated Professor of Agriculture, Drainage, and Irrigation in the École des Mines. Delesse's earliest researches were directed to pure mineralogy, and he paid great attention to the subjects of pseudomorphs and the association of minerals, and this led him to study the question of the metamorphism of rocks. The outcome of this period of study was his well-known work, "Recherches sur l'Origine des Roches," published in 1865, in which he argued ably and forcibly in favour of the view that crystalline rocks owe many of their characters to the action of superheated water, and are not produced by simple dry fusion. This important work of Delesse has exercised a marked and very beneficial influence on the progress of petrographical science, and its originality and value were at once recognised by the most advanced thinkers of the time. Already in 1858 Delesse had published two of his valuable maps, namely, the "Carte géologique soutterraine de la Ville de Paris" and the "Carte hydrologique de la Ville de Paris," and his subsequent studies came to be especially directed into the channels of inquiry which were associated with the professorship that he had created and so ably filled. In 1868 appeared his work on the Rainfall of France, and other memoirs treating of the agricultural bearings of geology were produced about the same period.

The war of 1870 caused an interruption in the scientific labours of Delesse, and we find him at this period superintending the construction of cartridges in the departments. But in 1878 he was appointed an Inspector-General of Mines, and the south-east of France was assigned to him as his district. During the last twenty years Delesse has issued, in conjunction with MM. Langel and de Lapparent, a series of annual volumes entitled "Revue de Géologie," a work of such value that we regret to hear that it is to be discontinued in the future. Delesse received many honours in recognition of his valuable labours. He was an officer of the Legion of Honour, and filled the post of President of the Geological Society of France. As long ago as 1859 he was elected a Foreign Member of our own Geological Society. He was also for two years President of the French Geological Society, and he occupied the chair during the International Congress of that Society in 1875. In 1879 Delesse was elected a Member of the Academy of Sciences. In Delesse France has lost one of her most distinguished and widely-known scientific men.

PROFESSOR HELMHOLTZ'S FARADAY LECTURE

ON Tuesday evening Prof. Helmholtz gave the Faraday Lecture of the Chemical Society at the Royal Institution. We have so recently (NATURE, vol. xv. p. 389) given a full account of the life and work of the eminent German worker in various departments of science, that it is unnecessary to go over the ground again. A very fair estimate of his position was given in a leading article in the *Times* of Saturday last; and we are glad to notice that the leading journal now is glad to draw attention to men of science whose work is deserving of public notice. The University of Cambridge did itself the honour of conferring upon Prof. Helmholtz the degree of LL.D. on Thursday last, on which occasion the public orator, Mr. Sandys, made the following elegant and appropriate speech:—

"Dignissime domine, domine Procancellarie, et tota Academia:

"Singularum quidem scientiarum terminos protulisse, plurimis concessum est; uni vero plurimarum fines extendisse raro contigit. Atqui hodie virum salutamus, qui rerum naturae regionem plusquam unam feliciter occupavit, qui primum physiologiae penetralia perscrutatus, deinde physicorum studiorum campo amplissimo potitus, ipsam denique mathematicorum arcem fortiter expugnavit, ex alia deinceps in aliam provinciam progressus, velut militum Romanorum ille maximus, 'victrices aquilas alium laturus in orbem.'

"Militarium medicorum ordini adhuc adscriptus, argumentum magnum intra unius libelli fines artiores complexus, ostendit vim illam, quae nonnunquam viva vocatur, in universa rerum natura esse conservatam, partes eius aliam ex alia posse generari, summam esse immutabilem. Quid huius ingenio excogitatas commemorem quaestiones illas hydrodynamicas, quid vortices illos qui scientiae mathematicae ad interiora pertinent? Illa vero magna opera, quorum in uno sensus audiendi clarissime explicatur, in altero videndi sensus pulcherrime illustratur, omnes, nisi fallor, aut vidistis ipsi, aut fama certe audivistis. Pulchrum est (uti hunc ipsum confitentem legimus), pulchrum profecto est, e scopulo quodam excelso late tumultuantem oceanum prospicere, fluctusque procul albescentes, modo breviores, modo longiores, oculis discernere: pulchrius autem in physiologiae templo intimo versatum, oculorum ipsorum structuram exquisitam introspicere, et, lucis legibus obscuris ordine lucido evolutis, fluctuantes luminis motus metiri variamque colorum venustatem explicare: omnium fortasse pulcherrimum, in iisdem arcanis morantem, undas illas aeris quas nulla nisi mentis acie contemplari possumus, inter sese audiendo distinguere; sonitus cuiusque, dum tremit vibratque, intervalla numerare; universam denique musices theoriam et mathematicis et physicis et physiologicis probavisse argumentis.

"Ille igitur qui tot provinciarum confinia lustravit, tot scientiarum fines propagavit, a nostra praesertim Academia, cuius alumni totiens ex eodem studiorum campo laureas reportarunt, ea qua par est reverentia hodie excipitur. Qui Academiae nostrae nemora, et iuventutis Academicae ludos et certamina iampridem admiratus est, idem fortasse severiora nostra studia quo melius noverit, eo benignius indies aestimabit. Vos certe, qui, talium virorum exemplar procul venerati, etiam nostras inter silvas verum quaeritis, quanquam hodie nemora illa nostra gravis umbra contristat, tamen inter ipsas lacrimas non sine gaudio virum magnum vidistis, quaque soletis benevolentia laudatum audivistis.

"'Vobis igitur praesento Academiae Berolinensis Professorem illustrem, HERMANNUM LUDOVICUM FERDINANDUM HELMHOLTZ."

The Society of Telegraph Engineers are to give a *conversazione* in honour of the distinguished electrician at University College, Gower Street, on the evening of the 11th inst. The large library and entrance hall will be lit up by electric light, and it is hoped there will be a full display of all the recent novelties in electrical science.

As might have been expected, there was a distinguished audience on Tuesday evening to listen to Prof. Helmholtz at the Royal Institution. Prof. Roscoe, the President of the Chemical Society, in introducing the lecturer, made the following remarks:—

"Ladies and Gentlemen, Fellows of the Chemical Society—The cordial welcome which you have just given to Prof. Helmholtz shows me that he needs no formal introduction at my hands. His name is honoured wherever science is valued, and both his face and his voice are well remembered in this room. It may therefore suffice if I say that eminent as an anatomist, as a physiologist, as a physicist, and as a mathematician, we chemists are now about to claim him also as our own.

"Prof. Helmholtz, in the name of the Chemical Society, and on behalf of its Fellows here assembled, I beg to welcome you amongst us; I have the honour to present you with the Faraday Medal of the Society, and to request that you will favour us with your lecture, to which we shall all listen with pleasure and profit."

The Faraday Lecture[1]

THE majority of Faraday's own researches were connected, directly or indirectly, with questions regarding the nature of electricity, and his most important and most renowned discoveries lay in this field. The facts which he has found are universally known. Nevertheless, the fundamental conceptions by which Faraday has been led to these much-admired discoveries have not been received with much consideration. His principal aim was to express in his new conceptions only facts, with the least possible use of hypothetical substances and forces. This was really a progress in general scientific method, destined to purify science from the last remnants of metaphysics. Now that the mathematical interpretation of Faraday's conceptions regarding the nature of electric and magnetic force has been given by Clerk Maxwell, we see how great a degree of exactness and precision was really hidden behind his words, which to his contemporaries appeared so vague or obscure; and it is astonishing in the highest degree to see what a large number of general theories, the methodical deduction of which requires the highest powers of mathematical analysis, he has found by a kind of intuition, with the security of instinct, without the help of a single mathematical formula.

The electrical researches of Faraday, although embracing a great number of apparently minute and disconnected questions, all of which he has treated with the same careful attention and conscientiousness, are really always aiming at two fundamental problems of natural philosophy, the one more regarding the nature of physical forces, or of forces working at a distance; the other, in the same way, regarding chemical forces, or those which act from molecule to molecule, and the relation between these and the first.

The great fundamental problem which Faraday called up anew for discussion was the existence of forces working directly at a distance without any intervening medium. During the last and the beginning of the present century the model after the likeness of which nearly all physical theories had been formed was the force of gravitation acting between the sun, the planets, and their satellites. It is known how, with much caution and even reluctance, Sir Isaac Newton himself proposed his grand hypothesis, which was destined to become the first great and imposing example, illustrating the power of true scientific method.

But then came Oerstedt's discovery of the motions of magnets under the influence of electric currents. The force acting in these phenomena had a new and very singular character. It seemed as if it would drive a single isolated pole of a magnet in a circle around the wire conducting the current, on and on without end, never coming to rest. Faraday saw that a motion of this kind could not be produced by any force of attraction or repulsion, working from point to point. If the current is able to increase the velocity of the magnet, the magnet must react on the current. So he made the experiment, and discovered induced currents; he traced them out through all the various conditions under which they ought to appear. He concluded that somewhere in a part of the space traversed by magnetic force there exists a peculiar state of tension, and that every change of this tension produces electromotive force. This unknown hypothetical state he called provisionally the electrotonic state, and he was occupied for years and years in finding out what was this electrotonic state. He discovered at first, in 1838, the dielectric polarisation of electric insulators, subject to electric forces. Such bodies show, under the influence of electric forces, phenomena perfectly analogous to those exhibited by soft iron under the influence of the magnetic force. Eleven years later, in 1849, he was able to demonstrate that all ponderable matter is magnetised under the influence of sufficiently intense magnetic force, and at the same time he discovered the phenomena of diamagnetism, which indicated that even space, devoid of all ponderable matter, is magnetisable; and now with quite a wonderful sagacity and intellectual precision Faraday performed in his brain the work of a great mathematician without using a single mathematical formula. He saw with his mind's eye that by these systems of tensions and pressures produced by the dielectric and magnetic polarisation of space which surrounds electrified bodies, magnets or wires conducting electric currents, all the phenomena of electro-static, magnetic, electro-magnetic attraction, repulsion, and induction could be explained, without recurring at all to forces acting directly at a distance. This was the part of his path where so few could follow him; perhaps a Clerk Maxwell, a second man of the same power and independence of intellect, was necessary to reconstruct in the normal methods of science the great building, the plan of which Faraday had conceived in his mind and attempted to make visible to his contemporaries.

---

[1] Abstract prepared by the author.

Nevertheless the adherents of direct action at a distance have not yet ceased to search for solutions of the electromagnetic problem. The present development of science, however, shows, as I think, a state of things very favourable to the hope that Faraday's fundamental conceptions may in the immediate future receive general assent. His theory, indeed, is the only existing one which is at the same time in perfect harmony with the facts observed, and which at least does not lead into any contradiction against the general axioms of dynamics.

It is not at all necessary to accept any definite opinion about the ultimate nature of the agent which we call electricity.

Faraday himself avoided as much as he could giving any affirmative assertion regarding this problem, although he did not conceal his disinclination to believe in the existence of two opposite electric fluids.

For our own discussion of the electro-chemical phenomena, to which we shall turn now, I beg permission to use the language of the old dualistic theory, because we shall have to speak principally on relations of quantity.

I now turn to the second fundamental problem aimed at by Faraday, the connection between electric and chemical force. Already, before Faraday went to work, an elaborate electro-chemical theory had been established by the renowned Swedish chemist Berzelius, which formed the connecting-link of the great work of his life, the systematisation of the chemical knowledge of his time. His starting point was the series into which Volta had arranged the metals according to the electric tension which they exhibit after contact with each other. A fundamental point which Faraday's experiment contradicted was the supposition that the quantity of electricity collected in each atom was dependent on their mutual electro-chemical differences, which he considered as the cause of their apparently greater chemical affinity. But although the fundamental conceptions of Berzelius' theory have been forsaken, chemists have not ceased to speak of positive and negative constituents of a compound body. Nobody can overlook that such a contrast of qualities, as was expressed in Berzelius' theory, really exists, well-developed at the extremities, less evident in the middle terms of the series, playing an important part in all chemical actions, although often subordinated to other influences.

When Faraday began to study the phenomena of decomposition by the galvanic current, which of course were considered by Berzelius as one of the firmest supports of his theory, he put a very simple question, the first question indeed which every chemist speculating about electrolysis ought to have answered. He asked, What is the quantity of electrolytic decomposition if the same quantity of electricity is sent through several electrolytic cells? By this investigation he discovered that most important law, generally known under his name, but called by him the law of definite electrolytic action.

Faraday concluded from his experiments that a definite quantity of electricity cannot pass a voltametric cell containing acidulated water between electrodes of platinum without setting free at the negative electrode a corresponding definite amount of hydrogen, and at the positive electrode the equivalent quantity of oxygen, one atom of oxygen for every pair of atoms of hydrogen. If instead of hydrogen any other element capable of substituting hydrogen is separated from the electrolyte, this is done also in a quantity exactly equivalent to the quantity of hydrogen which would have been evolved by the same electric current.

Since that time our experimental methods and our knowledge of the laws of electrical phenomena have made enormous progress, and a great many obstacles have now been removed which entangled every one of Faraday's steps and obliged him to fight with the confused ideas and ill-applied theoretical conceptions of some of his contemporaries. We need not hesitate to say that the more experimental methods were refined, the more the exactness and generality of Faraday's law was confirmed.

In the beginning Berzelius and the adherents of Volta's original theory of galvanism, based on the effects of metallic contact, raised many objections against Faraday's law. By the combination of Nobili's astatic pairs of magnetic needles with Schweigger's multiplicator, a coil of copper wire with numerous circumvolutions, galvanometers became so delicate that the electro-chemical equivalent of the smaller currents they indicated was imperceptible for all chemical methods. With the newest galvanometers you can very well observe currents which would want to last a century before decomposing one milligram of water, the smallest quantity which is usually weighed on chemical balances. You see that if such a current lasts only some seconds or some minutes, there is not the slightest hope to discover its products of decomposition by chemical analysis. And even if it should last a long time the feeble quantities of hydrogen collected at the negative electrode can vanish, because they combine with the traces of atmospheric oxygen absorbed by the liquid. Under such conditions a feeble current may continue as long as you like without producing any visible trace of electrolysis, even not of galvanic polarisation, the appearance of which can be used as an indication of previous electrolysis. Galvanic polarisation, as you know, is an altered state of the metallic plates which have been used as electrodes during the decomposition of an electrolyte. Polarised electrodes, when connected by a galvanometer, give a current which they did not give before being polarised. By this current the plates are discharged again and returned to their original state of equality.

This depolarising current is indeed a most delicate means of discovering previous decomposition. I have really ascertained that under favourable conditions one can observe the polarisation produced during some seconds by a current which decomposes one milligram of water in a century.

Products of decomposition cannot appear at the electrodes without motions of the constituent molecules of the electrolyte throughout the whole length of the liquid. This subject has been studied very carefully and for a great number of liquids, by Prof. Hittorff, of Munster, and Prof. G. Wiedemann, of Leipsic.

Prof. F. Kohlrausch, of Wurzburg, has brought to light the very important fact that in diluted solutions of salts, including hydrates of acids and hydrates of caustic alkalis, every atom under the influence of currents of the same density moves on with its own peculiar velocity, independently of other atoms moving at the same time in the same or in opposite directions. The total amount of chemical motion in every section of the fluid is represented by the sum of the equivalents of the cation gone forwards and of the anion gone backwards, in the same way as in the dualistic theory of electricity, and the total amount of electricity flowing through a section of the conductor corresponds to the sum of positive electricity going forwards and negative electricity going backwards.

This established, Faraday's law tells us that through each section of an electrolytic conductor we have always equivalent electrical and chemical motion. The same definite quantity of either positive or negative electricity moves always with each univalent ion, or with every unit of affinity of a multivalent ion, and accompanies it during all its motions through the interior of the electrolytic fluid. This we may call the electric charge of the atom.

Now the most startling result, perhaps, of Faraday's law is this: If we accept the hypothesis that the elementary substances are composed of atoms we cannot avoid concluding that electricity also, positive as well as negative, is divided into definite elementary portions, which behave like atoms of electricity. As long as it moves about on the electrolytic liquid each atom remains united with its electric equivalent or equivalents. At the surface of the electrodes decomposition can take place if there is sufficient electromotive power, and then the atoms give off their electric charges and become electrically neutral.

Now arises the question, Are all these relations between electricity and chemical combination limited to that class of bodies which we know as electrolytes? In order to produce a current of sufficient strength to collect enough of the products of decomposition without producing too much heat in the electrolyte, the substance which we try to decompose ought not to have too much resistance against the current. But this resistance may be very great, and the motion of the ions may be very slow, so slow indeed that we should need to allow it to go on for hundreds of years before we should be able to collect even traces of the products of decomposition; nevertheless all the essential attributes of the process of electrolysis could subsist. If you connect an electrified conductor with one of the electrodes of a cell filled with oil of turpentine, the other with the earth, you will find that the electricity of the conductor is discharged unmistakably more rapidly through the oil of turpentine than if you take it away and fill the cell only with air.

Also in this case we may observe polarisation of the electrodes as a symptom of previous electrolysis. Another sign of electrolytic conduction is that liquids brought between two different metals produce an electromotive force. This is never done by metals of equal temperature, or other conductors which, like metals, let electricity pass without being decomposed.

The same effect is also observed even with a great many rigid bodies, although we have very few solid bodies which allow us to observe this electrolytic conduction with the galvanometer, and even these only at temperatures near to their melting-point. It is nearly impossible to shelter the quadrants of a delicate electrometer against being charged by the insulating bodies by which they are supported.

In all the cases which I have quoted one might suspect that traces of humidity absorbed by the substance or adhering to their surface were the electrolytes. I show you therefore this little Daniell's cell, in which the porous septum has been substituted by a thin stratum of glass. Externally all is symmetrical at both poles; there is nothing in contact with the air but a closed surface of glass, through which two wires of platinum penetrate. The whole charges the electrometer exactly like a Daniell's cell of very great resistance, and this it would not do if the septum of glass did not behave like an electrolyte. All these facts show that electrolytic conduction is not at all limited to solutions of acids or salts.

Hitherto we have studied the motions of ponderable matter as well as of electricity, going on in an electrolyte. Let us study now the forces which are able to produce these motions. It has always appeared somewhat startling to everybody who knows the mighty power of chemical forces, the enormous quantity of heat and of mechanical work which they are able to produce, and who compares with it the exceedingly small electric attraction which the poles of a battery of two Daniell's cells show. Nevertheless this little apparatus is able to decompose water.

The quantity of electricity which can be conveyed by a very small quantity of hydrogen, when measured by its electrostatic forces, is exceedingly great. Faraday saw this, and has endeavoured in various ways to give at least an approximate determination. The most powerful batteries of Leyden jars, discharged through a voltameter, give scarcely any visible traces of gases. At present we can give definite numbers. The result is that the electricity of 1 mgrm. of water, separated and communicated to two balls, 1 kilometre distant, would produce an attraction between them, equal to the weight of 25,000 kilos.

The total force exerted by the attraction of an electrified body upon another charged with opposite electricity is always proportional to the quantity of electricity contained in the attracting as on the attracted body, and therefore even the feeble electric tension of two Daniell's elements acting through an electrolytic cell upon the enormous quantities of electricity with which the constituent ions of water are charged, is mighty enough to separate these elements and to keep them separated.

We now turn to investigate what motions of the ponderable molecules require the action of these forces. Let us begin with the case where the conducting liquid is surrounded everywhere by insulating bodies. Then no electricity can enter, none can go out through its surface, but positive electricity can be driven to one side, negative to the other, by the attracting and repelling forces of external electrified bodies. This process going on as well in every metallic conductor is called "electrostatic induction." Liquid conductors behave quite like metals under these conditions. Prof. Wüllner has proved that even our best insulators, exposed to electric forces for a long time, are charged at last quite in the same way as metals would be charged in an instant. There can be no doubt that even electromotive forces going down to less than $\frac{1}{100}$ Daniell produce perfect electrical equilibrium in the interior of an electrolytic liquid.

Another somewhat modified instance of the same effects is afforded by a voltametric cell containing two electrodes of platinum, which are connected with a Daniell's cell, the electromotive force of which is insufficient to decompose the electrolyte. Under this condition the ions carried to the electrodes cannot give off their electric charges. The whole apparatus behaves, as was first accentuated by Sir W. Thomson, like a condenser of enormous capacity.

Observing the polarising and depolarising currents in a cell containing two electrodes of platinum, hermetically sealed and freed of all air, we can observe these phenomena with the most feeble electromotive forces of $\frac{1}{1000}$ Daniell, and I found that down to this limit the capacity of the platinum surfaces proved to be constant. By taking greater surfaces of platinum I suppose it will be possible to reach a limit much lower than that. If any chemical force existed besides that of the electrical charges which could bind all the pairs of opposite ions together, and required any amount of work to be vanquished, an inferior limit to the electromotive forces ought to exist, which forces are able to attract the atoms to the electrodes and to charge these as condensers. No phenomenon indicating such a limit has as yet been discovered, and we must conclude therefore that no other force resists the motions of the ions through the interior of the liquid than the mutual attractions of their electric charges.

On the contrary, as soon as an ion is to be separated from its electrical charge we find that the electrical forces of the battery meet with a powerful resistance, the overpowering of which requires a good deal of work to be done. Usually the ions, losing their electric charges, are separated at the same time from the liquid; some of them are evolved as gases, others are deposited as rigid strata on the surface of the electrodes, like galvanoplastic copper. But the union of two constituents having powerful affinity to form a chemical compound, as you know very well, produces always a great amount of heat, and heat is equivalent to work. On the contrary, decomposition of the compound substances requires work, because it restores the energy of the chemical forces, which has been spent by the act of combination.

Metals uniting with oxygen or halogens produce heat in the same way, some of them, like potassium, sodium, zinc, even more heat than an equivalent quantity of hydrogen; less oxidisable metals, like copper, silver, platinum, less. We find therefore that heat is generated when zinc drives copper out of its combination with the compound halogen of sulphuric acid, as is the case in a Daniell's cell.

If a galvanic current passes through any conductor, a metallic wire, or an electrolytic fluid, it evolves heat. Mr. Prescott Joule was the first who proved experimentally that if no other work is done by the current the total amount of heat evolved in a galvanic circuit during a certain time is exactly equal to that which ought to have been generated by the chemical actions which have been performed during that time. But this heat is not evolved at the surface of the electrodes, where these chemical actions take place, but is evolved in all the parts of the circuit, proportionally to the galvanic resistance of every part. From this it is evident that the heat evolved is an immediate effect, not of the chemical action, but of the galvanic current, and that the chemical work of the battery has been spent in producing only the electric action.

If we apply Faraday's law, a definite amount of electricity passing through the circuit corresponds to a definite amount of chemical decomposition going on in every electrolytic cell of the same circuit. According to the theory of electricity the work done by such a definite quantity of electricity which passes, producing a current, is proportionate to the electromotive force acting between both ends of the conductor. You see therefore that the electromotive force of a galvanic circuit must be, and is indeed, proportional to the heat generated by the sum of all the chemical actions going on in all the electrolytic cells during the passage of the same quantitity of electricity. In cells of the galvanic battery chemical forces are brought into action able to produce work; in cells in which decomposition is occurring work must be done against opposing chemical forces; the rest of the work done appears as heat evolved by the current, as far as it is not used up to produce motions of magnets or other equivalents of work.

Hitherto we have supposed that the ion with its electric charge is separated from the fluid. But the ponderable atoms can give off their electricity to the electrode, and remain in the liquid, being now electrically neutral. This makes almost no difference in the value of the electromotive force. For instance, if chlorine is separated at the anode, it will remain at first absorbed by the liquid; if the solution becomes saturated, or if we make a vacuum over the liquid, the gas will rise in bubbles. The electromotive force remains unaltered. The same may be observed with all the other gases. You see in this case that the change of electrically negative chlorine into neutral chlorine is the process which requires so great an amount of work, even if the ponderable matter of the atoms remains where it was.

The more the surface of the positive electrode is covered with negative atoms of the anion, and the negative with the positive ones of the cation, the more the attracting force of the electrodes exerted upon the ions of the liquid is diminished by this second stratum of opposite electricity covering them. On the contrary, the force with which the positive electricity of an atom of hydrogen is attracted towards the negatively charged metal increases in proportion as more negative electricity collects before it on the metal, and the more negative electricity collects behind it in the fluid.

Such is the mechanism by which electric force is concentrated and increased in its intensity to such a degree that it becomes able to overpower the mightiest chemical affinities we know of. If this can be done by a polarised surface, acting like a condenser, charged by a very moderate electromotive force, can the attractions between the enormous electric charges of anions and cations play an unimportant and indifferent part in chemical affinity?

You see, therefore, if we use the language of the dualistic theory and treat positive and negative electricities as two substances, the phenomena are the same as if equivalents of positive and negative electricity were attracted by different atoms, and perhaps also by the different values of affinity belonging to the same atom with different force. Potassium, sodium, zinc, must have strong attraction to a positive charge; oxygen, chlorine, bromine to a negative charge.

Faraday very often recurs to this to express his conviction that the forces termed chemical affinity and electricity are one and the same. I have endeavoured to give you a survey of the facts in their mutual connection, avoiding, as far as possible, introducing other hypotheses, except the atomic theory of modern chemistry. I think the facts leave no doubt that the very mightiest among the chemical forces are of electric origin. The atoms cling to their electric charges and the opposite electric charges cling to the atoms. But I don't suppose that other molecular forces are excluded, working directly from atom to atom. Several of our leading chemists have begun lately to distinguish two classes of compounds, molecular aggregates and typical compounds. The latter are united by atomic affinities, the former not. Electrolytes belong to the latter class.

If we conclude from the facts that every unit of affinity of every atom is charged always with one equivalent either of positive or of negative electricity, they can form compounds, being electrically neutral, only if every unit charged positively unites under the influence of a mighty electric attraction with another unit charged negatively. You see that this ought to produce compounds in which every unit of affinity of every atom is connected with one and only with one other unit of another atom. This is, as you will see immediately, indeed, the modern chemical theory of quantivalence, comprising all the saturated compounds. The fact that even elementary substances, with few exceptions, have molecules composed of two atoms, makes it probable that even in these cases electric neutralisation is produced by the combination of two atoms, each charged with its electric equivalent, not by neutralisation of every single unit of affinity.

But I abstain from entering into mere specialities, as, for instance, the question of unsaturated compounds; perhaps I have gone already too far. I would not have dared to do it if I did not feel myself sheltered by the authority of that great man who was guided by a never-erring instinct of truth. I thought that the best I could do for his memory was to recall to the minds of the men, by the energy and intelligence of whom chemistry has undergone its modern astonishing development, what important treasures of knowledge lie still hidden in the works of that wonderful genius. I am not sufficiently acquainted with chemistry to be confident that I have given the right interpretation, that interpretation which Faraday himself would have given perhaps, if he had known the law of chemical quantivalence, if he had had the experimental means of ascertaining how large the extent, how unexceptional the accuracy of his law really is; and if he had known the precise formulation of the law of energy applied to chemical work, and of the laws which determine the distribution of electric forces in space as well as in ponderable bodies transmitting electric current or forming condensers. I shall consider my work of to-day well rewarded if I have succeeded in kindling anew the interest of chemists for the electro-chemical part of their science.

At the conclusion of the lecture Prof. Roscoe made the following remarks:—

"The pleasing duty now devolves upon me of proposing a vote of thanks to our distinguished friend for his interesting, suggestive, and most appropriate address.

"Prof. Helmholtz has shown us that Faraday's conception of electricity is in exact accordance with the most modern developments of this science. He has told us that although Faraday was unacquainted with the technical details of mathematics, all his conclusions are capable of the most exact mathematical expression, and that our great experimentalist possessed the spirit and thoughts characteristic of a truly mathematical mind. But our lecturer has gone further, for upon Faraday's well-known law of electrolysis he has founded a new electro-chemical theory, which reveals to us chemists, conclusions of the utmost importance. He tells us as the results of the application of the modern theory of electricity to Faraday's great experimental law, that the atom of every chemical element is always united with a definite unvarying quantity of electricity. Moreover—and this is most important—that this definite amount of electricity attached to each atom stands in close connection with the combining power of the atom which modern chemistry terms quantivalence. For if the amount of electricity belonging to the monad atom be taken as the unit, then that of the dyad atom is two, of the triad atom three, and so on.

"Hence then, thanks first to Faraday and now to Helmholtz, chemists have now a new and unlooked-for confirmation of one of their most important doctrines from the science of electricity.

"These, Ladies and Gentlemen, are indeed sufficient grounds for our claiming Prof. Helmholtz as a chemist, and justify me in requesting that he will allow his name to be placed on the list of Honorary Fellows of the Chemical Society.

"I have much pleasure in proposing a hearty vote of thanks to the Faraday Lecturer for the year."

This proposal was seconded by Prof. Tyndall.

NOTES

MR. CLARENCE KING has resigned his position as Director of the Geological Survey of the United States. It has long been no secret that he wished to retire from an appointment which confined him chiefly to executive functions, left him with practically no time for independent scientific work, and hampered him in those mining and other financial operations in which he is understood to have large investments. In a letter dated the 12th ult., addressed to the President of the United States, he says that he believes he "can render more important service to science as an investigator than as the head of an executive bureau." All well-wishers to the cause of geology must hope that this belief will be fully justified; that the relief he obtains from official trammels will enable him once more to devote to geological research the energy and experience which have already borne such good fruit. His tenure of office in the Geological Survey has hardly been long enough to enable him fully to develop the plans he had sketched out for the vigorous prosecution of the Survey as a truly national undertaking, alike creditable to the scientific spirit of the Republic and important to the development of its industrial resources. But he will be held in honourable remembrance as the first head of the National Survey, and as having taken a leading share in its initial organisation. It is reported that Mr. J. W. Powell, so long and well known for his work in the Rio Colorado basin, is to be the new director.

A WISH having been expressed by certain members of the Torquay Natural History Society to have a portrait of Mr. William Pengelly, F.R.S., &c., and he having kindly consented to sit for the same, a committee has been formed for carrying the suggestion into effect. The portrait will, at Mr. Pengelly's request, be placed in the museum of the Society, Torquay. It was at first proposed to limit the list of subscribers to the members of the Torquay Natural History Society, but some members of the Devonshire Association, and other gentlemen, having expressed a wish to join in the work, it has been decided to make the contribution general. Subscriptions will be received by the hon. treasurer, Mr. Robert Kitson, Torquay Bank.

THE Royal Academy of Sciences of Turin gives notice that from January 1, 1879, the new term for competition for the third Bressa Prize has begun, to which, according to the testator's will, scientific men and inventors of all nations will be admitted. A prize will therefore be given to the scientific author or inventor, whatever be his nationality, who during the years 1879–1882, "according to the judgment of the Royal Academy of Sciences of Turin, shall have made the most important and useful discovery, or published the most valuable work on physical and experimental science, natural history, mathematics, chemistry, physiology and pathology, as well as geology, history, geography and statistics." The term will be closed at the end of December, 1882. The value of the prize amounts to 12,000 Italian lire. The prize will in no case be given to any of the national members of the Academy of Turin, resident or non-resident.

THE Literary and Philosophical Society of Manchester has recently completed the first century of its existence. Dr. Angus Smith is writing a history of the Society since its foundation, which will be read at an early meeting, and no doubt published in its *Proceedings*.

WE are glad to learn that the appeal on behalf of G. M. Smerdon, who has done such good work as foreman of the Kent Cavern explorations, has resulted in a sum sufficient to purchase him an annuity of 10*l*.

THE results of appointing a totally inexperienced and unknown man to the head of the Registrar-General's department, just before the taking of the census, are already beginning to be felt. Complaints of mismanagement are rife—whole streets in London not served with the census-papers, and in many cases those which were delivered have not yet been collected, and run some risk of being utilised for fire-lighting purposes. Certainly the interests of the country would have been best served by appointing Dr. Farr to the post of Registrar-General until at least the census-work had been completed. Dr. Farr's long experience would have been of immense service, and these useful statistics would have been collected in something like scientific method.

THERE was a desultory talk on the subject of Technical Education in the House of Commons the other night, on the motion of Mr. Anderson to appoint a roving Commission to inspect the technical schools of the Continent. The fact is, as Mr. Mundella pointed out, we know quite well what is wanted here, and if the City Guilds would only spend the amount of money they ought to do, there need be no want of technical instruction for all who are prepared to take advantage of it. As it is, such institutions as Owens College, the Mason College, and others are putting a first-rate scientific technical education within the reach of all classes, and what is really wanted is the teaching of elementary science in all our primary schools. The House was counted out over the motion.

A MEETING for the purpose of forming a society for the advancement of chemical industry was held on Monday afternoon at the rooms of the Chemical Society, Burlington House, Piccadilly, Prof. Roscoe presiding. The chairman explained that for some time the want of a Society had been felt, the object of which was the advancement of chemical industry in the United Kingdom. Its main purpose would be to bring together at stated intervals all those who possessed chemical, physical, and engineering knowledge, and who used this knowledge in the utilisation of chemical action on a manufacturing scale, and who had the charge of or an interest in chemical industries. It might afterwards prove desirable to found a distinct branch of the engineering profession, who might be designated as chemical engineers. He drew attention to the advantages which would doubtless accrue to the various branches of chemical industry by the establishment of such an organisation. Briefly stated, its objects would be to enable persons interested in chemical industries to meet, to correspond, and to interchange ideas respecting improvements in the various processes, to publish information relating thereto by means of a journal or otherwise, to acquire and dispose of property for such purposes, and to do all other things incidental or conducive to the objects aimed at. Prof. Roscoe concluded by moving that it was desirable to form such a society as that suggested. This was seconded by Mr. Perkin and carried. Formal resolutions were then passed with the view of carrying out the object thus agreed upon.

WE take the following significant passage from a paper read by Sir George Campbell, K.C.S.I., M.P., late Lieutenant-Governor of Bengal, to the Society of Arts on March 25 last:—"Most of us who go to India know very little about agriculture of any kind; and of agriculture under the conditions of Indian soil and climate we know nothing whatever. The consequence has been that when we have attempted to show the natives how to improve their agriculture we have generally egregiously failed, and to use a native expression, our faces have been blackened. In this respect I am afraid we are not improving. The old-fashioned civil servant, if not so literary as the new class, and perhaps not much more agricultural, settled down more in the country and learned more of native agricultural habits and ways. Present administrators, I am afraid, know very little of any kind of agriculture, and it is much the same with the native public servant; formerly they knew nothing of English literature, but they knew a great deal of the country; now they are very highly educated, but do not know much more of agriculture than their European superiors."

THE post of Curator of the Herbarium of the Royal Botanic Gardens, Calcutta, has been filled up by the India Office by the appointment, on the nomination of the Director of the Royal Gardens, Kew, of Mr. L. J. K. Brace, of New Providence, Bahamas. Mr. Brace was educated at Christ's Hospital, and held a subordinate post in the colony. Having turned his attention to botany, he was employed by the late Governor, Mr. W. Robinson, to make a collection for Kew of the indigenous vegetation.

OF late years the cultivation of Liberian coffee (*Coffea Liberica*) has been energetically pushed in English coffee-growing colonies and possessions. This has been due to two causes:—First, the cultivation of Arabian coffee (*Coffea Arabica*) has been severely crippled in the New World by the "white fly" (*Cemiostoma coffeellum*), and in the Old by the "leaf disease" (*Hemileia vastatrix*); secondly, Liberian coffee being a more tropical plant, grows well at a zone of altitude below that which Arabian coffee requires. The produce of the plantations of the new species is now coming into commerce. At present it does not find much favour apparently in England, but in America it is better appreciated. Recent sales at New York of Ceylon-grown Liberian coffee have realised 93*s*. per cwt., or 12*s*. above the current quotation for middling plantation coffee (Arabian) in the London market. This is a result of great importance for the West Indian Islands. Liberian coffee has been found in Dominica to possess a comparative immunity from the attacks of the white fly, the ravages of which had all but completely extinguished the coffee-cultivation of the island. Not merely therefore can West Indian coffee cultivation be revived with reasonable prospect of success, but there is the additional encouragement of a ready market easy of access in the United States.

THE death is announced, at the age of seventy-five, of Sir Philip de Malpas Grey Egerton. Sir Philip was an occasional contributor to our pages.

A STRONG shock of earthquake occurred on Sunday afternoon at Chio, which has caused terrible destruction. Many houses in the principal town and thirty villages in the island are said to have been destroyed, and 4000 persons killed. Fresh shocks of earthquake occurred on Monday, and the inhabitants were taking refuge on board the steamers in the harbour. The country around and the town Tsesme, on the mainland, suffered considerably, and shocks were also felt on Monday at Zante, Syra, Smyrna, Carosto, Eubœa, and Tinos. The island of Chio, Scio, or Skio, for the name is thus variously spelt, is situated in the Ægean Sea, separated from the coast of Anatolia by a channel not more than seven miles wide where narrowest, and about fifty-three miles west of Smyrna.

SOME of our readers may be glad to learn that the French Association has resolved to curtail the number of scientific meetings in order to extend the time left for excursions and festivals. The programme includes two receptions by the Mayor of Algiers, one by the Governor-General, and a large Arabian *fête* called *Bita*, dancing and singing by native women, &c. Possibly the reported massacre of the Flatters Expedition may put a stop to these ultra-scientific festivities.

WE notice that the names of Drs. Gladstone and Tribe are down for a paper in the Physical and Chemical Section of the meeting of the French Association at Algiers, as also that of Mr. Rodwell.

AT the ordinary meeting of the Sanitary Institute, to be held at 9, Conduit Street, on Wednesday, April 13, at 8 p.m., the Chairman of Council, Dr. Richardson, F.R.S., will give a short address entitled, "Some Brief Suggestions on the Best Mode of dealing with Small Pox and other Infectious Diseases in the Metropolis and other large Towns," to be followed by a discussion.

MR. R. J. FRISWELL writes:—As the following novel "facts" have their origin in *Truth* there can, I presume, be no gainsaying of them. As they are entirely new and are published in a journal not so well known as a scientific paper as it ought to be, will you be good enough to give them a wider currency for the information of chemists. Their value needs no comment:—"The bomb with which the Emperor was killed appears to have been filled with nitro-glycerine, and it is unfortunate that this compound, like gun-cotton, is so easy to make. A certain amount of glycerine is taken, and to this sulphuric and nitric acid are added. Glycerine has an affinity for water. A molecule of water is abstracted, and a molecule of nitrous acid takes its place. Nitro-glycerine may be put into the fire or it may be struck without any dangerous consequence. If however it be set on fire by a fulminant, there is an explosion. If, as stated, the Russian bombs were made of glass, there must have been small projections made in the glass shell when manufactured, filled with fulminating powder. The explosive character arises from this: Nitrogen is composed of molecules in pairs of atoms. Nitric acid contains only one atom in its molecules. Upon this atom being set free from its unstable combination in the glycerine, the two atoms of nitrogen rush together, producing a vast amount of energy of combination in the shape of heat. The gaseous products are thus heated, and an explosion takes place immediately."

A SCHOOL of Gardening and Practical Floriculture has been established at the Crystal Palace, under the superintendence of Mr. Edward Milner.

M. DAUDIGNY, electrical engineer in Paris, has sent to the Municipal Council a petition asking for authority to establish on the top of the Colonne de Juillet a large electric lamp fed by a magneto-electric machine of fifty horse-power. This enormous light is to be diffused by a large reflector of special construction.

A MOST successful experiment in theatre illumination was tried on March 30 and 31, at the Athenæum of the rue des Martyrs, Paris, with the Werdermann incandescent light. The peculiarity of it is that it can be graduated at will for scenic effects, either by introducing resistance coils or varying the velocity of the Gramme machine. These experiments were witnessed by several influential members of the Municipal Council, who on the following morning proposed an inquiry into the propriety of obliging all the theatrical managers to light their halls with electricity.

MR. F. W. PUTNAM sends us a paper on Pueblo Pottery, which he contributed to the February number of the *American Art Review*. There are some well-executed coloured illustrations of specimens of the pottery which show some little taste in colour and ornamentation.

WE have had several replies to our inquiry concerning the late Dr. Thomas Dick's astronomical instruments. They seem to have been disposed of after his death, and only one small instrument can be definitely traced. None of the instruments seem to have been of much scientific value.

MR. JOHNSTON-LAVIS writes, under date March 29:—"Vesuvius is to-night again active, lava running down the north-western slope of the cone. Only the reflection is visible from Naples. On Sunday morning a slight shock, or more correctly subterranean thunder, was felt at Casamicciola, although those in the ruins at the moment only became aware of it by the palor of others present, whose whole attention is arrested by the faintest move or noise."

A SCIENCE Students' Association has been formed in Liverpool, which includes all departments of science in its programme; the president is Mr. A. Norman Tate.

THE system of compressed-air clocks, of the use and construction of which in Paris we gave an account some time ago, is likely to have a trial in London. A Bill has been introduced into Parliament for this purpose. The number of stations proposed for the metropolis is ten.

IN the notice of the meeting of the Mathematical Society in NATURE, vol. xxiii. p. 379, Mr. Wooster Woodruff Beman's name was misspelt Benson.

LIEUT.-COL. H. COLLETT, of Meean Meer, North-West Punjab, has sent us a money-order for 3*l.* towards the John Duncan Fund. We also acknowledgereceipt of 1*l.* from M. G. S.

THE additions to the Zoological Society's Gardens during the past week include a Two-Spotted Paradoxure (*Nandinia binotata*) from West Africa, presented by Mr. A. Wentworth Forbes; a Golden Sparrow (*Auripasser euchlorus*) from Abyssinia, presented by Mr. J. Abrahams; a Chukar Partridge (*Caccabis chukar*), a Grey Francolin (*Francolinus ponticerianus*) from India, presented by M. J. M. Cornely, C.M.Z.S.; two Indian Antelopes (*Antelope cervicapra* ♂ ♂) from India, deposited; two Æthiopian Wart Hogs (*Phacochœrus æthiopicus* ♂ ♀) from South-East Africa, a Dusky Parrot (*Pionus violaceus*) from Guiana, three Ceylonese Hanging Parrakeets (*Loriculus asiaticus* ♂ ♂ ♀) from Ceylon, a Yellow Troupial (*Xanthosoma flavus*) from Buenos Ayres, purchased; a Fork-tailed Jungle Fowl (*Gallus furcatus* ♂) from Java, on approval; two Four-horned Antelopes (*Tetraceros quadricornis* ♂ ♀), a Burrhel Wild Sheep (*Ovis burrhel* ♂) from India, a Javan Adjutant (*Leptoptilus javanicus*) from Java, a Rock-hopper Penguin (*Eudyptes chrysocome*) from the Falkland Islands, received in exchange.

OUR ASTRONOMICAL COLUMN

THE VARIABLE STARS U CEPHEI AND U GEMINORUM.—We learn from Mr. Knott that Ceraski's short-period variable in Cepheus was at a minimum on March 29 at about 12h. 45m. G.M.T.; clouds prevented observations till 11h. 35m., when it had barely fallen to minimum; for two hours, 11h. 45m.—13h. 45m., the star's light was sensibly constant—about 9·4m. On April 3 Mr. Knott again obtained a pretty complete observation; the time of minimum, taking the middle of the phase, was 12h. 24m. G.M.T.; for nearly 2h. 30m., or from 11h. 10m. to 13h. 36m., the star remained about 9·4m. Guided by these and previous observations the following approximate times of minima are inferred, and it is to be hoped that the series may be well observed:—

		h.	m.			h.	m.			h.	m.
April	8 ...	12	4	April	23 ...	11	2	May	8 ...	9	59
	13 ...	11	43		28 ...	10	41		13 ...	9	39
	18 ...	11	22	May	3 ...	10	20		18 ...	9	18

This variable has been hitherto called T Cephei in this column, but Mr. Knott draws attention to the circumstance that Ceraski (*Astron. Nach.*, No. 2343) applied that designation last October to another variable discovered by him, the position of which by meridian observations at Moscow was found to be in R.A. 21h. 7m. 57·05s., Decl. + 68° 0′ 8″·4 for 1880·0, and we accordingly follow his suggestion that the short-period variable will be more properly termed U Cephei.

U Geminorum was observed by Mr. Knott at about the maximum, or about 9·3m., on April 2 and 3. Maxima of this very irregular variable star are by no means easy to catch. It precedes the principal component of Σ 1158 by 1m. 26·5s., and is north of it 7′ 31″. Prof. Winnecke gave a series of comparison stars in *Astron. Nach.*, No. 1120. Argelander's position for 1855 is R.A. 7h. 46m. 29·88s.; Decl. + 22° 22′ 41″·5.

While writing upon variable stars we may mention that B.A.C. 4767 is probably to be included among them. It was estimated 4m. by D'Agelet on May 15, 1783; it is called 6m. by Lacaille, Lalande, and Piazzi, and was so estimated in Argelander's Zone, No. 301; but although rated 5·7 in the *Uranometria Argentina* it is not found in Heis's Atlas nor in the Uranometria of Argelander. Its place for the present year is in R.A. 14h. 18m. 1s., with south declination, 24° 15′·6.

THE COMET OF 1812.—Several years since, Mr. W. E. Plummer of the University Observatory, Oxford, after a new reduction of the observations made at Paris and Viviers, which we possess in their original form, found the period of revolution about 1¼ years less than that given by Encke, so that it is quite possible that the comet may arrive again at perihelion within the present year. We have already mentioned that M. Schulhof of Paris is engaged upon a strict investigation of the elements of this comet, and has the intention of preparing extended ephemerides, in the same manner that he has done for several of the minor planets which had not been observed at several oppositions, but the sweeping lines for every fourth day throughout the year are given in Herr Mahn's ephemeris computed on the suggestion of Prof. Winnecke, which will be found in the *Vierteljahrsschrift der Astronomischen Gesellschaft*, 12 Jahrgang.

BIOLOGICAL NOTES

THE SHINING SLAVE-MAKER (POLYERGUS LUCIDUS).—The Rev. H. M'Cook is as fortunate as he is energetic in his studies of the American ants. At the December 1880, meeting of the Academy of Natural Sciences of Philadelphia he read a paper on the discovery at the foot of the Allegheny Mountains, near Altoona, of a nest of *Polyergus lucidus*, the American representative of the Legionary Ant of Huber (*P. rufescens*), an ant associated with that author's discovery of ant-nests, in which certain ants have associated with them, in a sort of slavery, ants of another species. The nest had four gates separated a few inches from each other; the chambers were placed one above the other, united by tubular galleries. In an inner ovoid chamber numbers of the ants, male and female, appeared; mingled with these in large numbers were workers in three forms—major, minor, and dwarf of *Formica Schaufussi*. A portion of the excavated nest was broken into, and on the next day but one was visited. None of the shining ants were at work, but the "slaves" were very busy cleaning out the galleries; a portion of the slaves were engaged in an extensive migration; a few were carrying their fellows, but for the most part the deportation was confined to the males and females of the shining ants. It was wonderful to see the large virgin-queens carried up the perpendicular face of the cutting for eighteen or twenty inches, and then for the distance of six feet over the ground and through the grass, and this in a few seconds over a minute. The shining ants are able to take a most wonderful grip. One of them had fallen under the displeasure of another, who held her firmly grasped by the middle thorax. Anxious to preserve the colony from unnecessary loss, Mr. M'Cook lifted the two out on the point of a quill toothpick, laid them on his hand, and thrust the fine point of the quill between the jaws of the agressor, and so teased her that she released her fellow. The rescued ant instantly clasped the palm of his hand, threw her abdomen under her, and then, with back curved like that of an angry cat, sawed and tugged away at the skin until an abrasion was made. The other ant still clung fast by her mandibles only to the toothpick's point, her body stretched out into space, her limbs stretched outwards, except one hind leg, which was a little bent upward, and thus without any perceptible support except that which her jaws gave her upon the quill-point, she hung outstretched for several minutes. About a month after its discovery the nest was again visited; it was abundantly peopled; the winged forms of the shining ant were however gone. Having succeeded in colonising these ants Mr. M'Cook was able to confirm in many particulars the statements of Huber, Forel, and others, but he never happened to see the slaves feeding their masters. He noticed that they seemed to like to move towards both warmth and light, but he does not seem to have settled the question whether they would not prefer the warmth without the light. They would appear to be very clean in their ways and persons. Various experiments seemed to establish the fact that these slave-makers always keep a guard ready at once for any attack.

ON THE RED COLOUR OF SALT COD.—During the hot and damp weather of summer in the United States the dried codfish sometimes exhibit a peculiar redness of colour. These red fish, as is well known, putrefy comparatively quickly, and this fact, taken in connection with the disagreeable, and in such fish unusual, colour, renders them unfit for market, so that in seasons when the redness prevails dealers in codfish suffer often very considerable losses. Prof. Farlow, M.D., was requested by the United States Fish Commission to investigate this subject, and his report appears in the Fish Report for 1880. In September, 1878, he went to Gloucester to examine the fish stores. The weather was at that time hot and damp, and the codfish then being prepared for the market were largely affected by the redness. This redness disappears with the return of cool weather. In most cases it does not appear until the fish have been landed from the vessels, though in a few cases the colour has appeared in the stock while still on board. A microscopical examination showed that the redness was owing to a very minute plant, *Clathrocystis roseo-persicina*, a species known to be closely related to *C. æruginosa*, so common in fresh-water ponds, and which has lately come into public notice in the States in consequence of the so-called *pig pen* odour which it exhales when decaying. This red species is known both in America and Europe, and has been recently investigated by Cohn and others. It may sometimes be found tinging the surface of damp ground with a purplish tinge, and the anatomist is not unfamiliar with it as growing in his macerating tubs. It would appear not to flourish or increase very rapidly at a temperature below 65° Fahr. How it got to attack the dried fish was the next question. It was found that the plants could come from many sources, for it was found present in quantities in the wood-work of the wharves and packing-stores, but above all Prof. Farlow detected it in the salt with which the fish were cured. The salt from Cadiz had even a slight rose tinge. It will be a matter of interest, which perhaps some of our readers may help to solve, as to whether this plant is known in European fish-stations. In the great Norwegian cod-fisheries the temperature may not be high enough to favour its growth. As remedies Prof. Farlow suggests care in the selection of salt, and the constant cleaning of all wood-work or vessels that may come in contact with the fish. In addition to the red alga small quantities of cells destitute of colouring-matter and arranged in fours were not unfrequently found in the infected cod-fish. These suggested the genus Sarcina, but were not *S. ventriculi*. They rather, except in the absence of colouring-matter, resembled *Glœocapsa crepidinum*, Thuret, which species is common enough on the wood-work of the Gloucester wharves. While there is this resemblance Prof. Farlow prefers for the moment, and pending further investigation, to call it a Sarcina, and to describe it as a new species (*S.? morrhuæ*).

MARINE ISOPODS OF NEW ENGLAND.—One of the most remarkable papers forming the extensive series of appendices to the Report of the United States Commissioners of Fish and Fisheries for 1878 is perhaps that by Oscar Harger on the marine Isopods of New England and adjacent waters. The limits chosen commence at Nova Scotia to the north and extend southwards to New Jersey. Forty-six species are recorded, and figures of these with the requisite details of anatomy are given on thirteen plates; several new species and one new genus (Syscenus) are described. It will be noted that the number of species is very considerably less than that known to frequent the British coasts, and of the former only eight are identical with British forms. This difference is very marked in the genus Sphæroma, of which genus there is but one species native to New England, while Bate and Westwood describe a dozen species belonging to this family as natives of Britain. *Limnoria lignorum*, one of the most destructive of the group, is apparently as common on the American coasts as on our own shores. It does not usually occur much below high-water mark, though Prof. Verrill has found it at a depth of ten fathoms in Casco Bay, and it was dredged by the U.S. Fish Commission at a depth of 7½ fathoms in Cape Cod Bay Massachusetts. Of the family of the Cymothoidæ, of which we believe as yet no species has been found around the British Islands, three species belonging to three different genera are in Mr. Harger's list.—To this memoir there is appended a very complete list of authorities and an alphabetical index.

STATISTICS OF DISEASE IN ITALY.—In a recent paper to the Lombard Institute, Prof. Sangalli gives statistics of the diseases which terminated fatally in the Civic Hospital of Pavia during the period 1855 to 1881. The material was 6614 bodies which came up for autopsy, and the causes of death were, in decreasing order, genuine inflammation, 4504 deaths; tuberculosis, 808; pyæmia, 337; cancer, 366; hepatic cirrhosis, 252; extravasation of blood in the brain, 254; chronic ulcer (gastric and duodenal), 72, &c. (there being 2140 deaths apart from those by true inflammation). The 4504 deaths from inflammation presented 7962 separate inflammations. The deaths from tuberculosis are seen to be about 12 per cent. The ages most exposed to that disease lie between 20 and 30; next come those between 10 and 20, and between 30 and 40, about equal. There were twelve cases between 70 and 80, and one in an old man of 84. It does not appear that one sex suffers more than the other. Cancer occurs most between 50 and 60, and most largely in liver, lymphatic glands, and stomach. The patients were largely of the peasant class, and the author cannot support Niemeyer's view, that people living in marshy districts, liable to malaria, have a certain immunity from tuberculosis. Nor do the figures confirm the asserted tendency of ulcer in the stomach to favour the development of tuberculosis. Pyæmia appeared mostly in the lungs (149 cases out of 470), pleura, 99; liver, 73, &c. In some years there was a remarkable diminution of this disorder.

THE EYE AND INTENSITY OF COLOUR.—With an apparatus consisting of two Nicols with a gypsum plate between, and a spectroscope with a third Nicol attached to the eye-piece, Herr Dobrowolsky has examined the sensibility of the eye to spectral colours with different intensities of light (Pfluger's *Archiv*, v. 24, p. 189). From a large number of measurements it was found that, on an average, the red-colour sensation first occurred with a light-quantity equal to $\frac{1}{1000}$, while for blue the lowest amount of light was $\frac{1}{16000}$. Thus blue gives a sensation with an amount of light sixteen times less than that required for red. With rise in the degree of brightness, the increase of sensibility to red proceeds pretty regularly; but for blue the increase becomes gradually greater (with the weakest degrees of brightness this increase was = 0·22, with the strongest 0·82, with the mean 0·36). Comparing the two sensibilities together, from the maximum of light strength to the minimum, the sensibility to blue is always found to exceed that to red (maximum thirteen and a half times, minimum sixteen times, mean four times).

ISOETES LACUSTRIS.—In an interesting paper read before the Academy of Sciences of Paris (January 10, 1881), M. E. Mer calls attention to the peculiar conditions under which different forms of this fresh-water plant seem to originate in the Lake of Longemer. The basin of this lake was once occupied by a glacier, and now presents several different sorts of bottom. The soil to a depth of two to three metres is composed in part of a gravel formed of rock *débris* united by an iron cement, in part of ancient moraines, or where near the surface these will be mixed with the remains of plants and form a pretty tenacious mud. In all these situations Isoetes is to be found, but the plants differ most remarkably both as to their form, their structure, and their mode of reproduction as they are found in the different habitats. Taking the leaf-development as a guide, four varieties are easily discerned:—(1) *humilis*, growing sparsely in the gravel and sterile shallows, the leaves are not only few in number, but always of diminutive dimensions; sporange generally wanting or represented by a small cellular mass which rarely ever forms a propagule, and then these with puny leaves; (2) *stricta*, found on the borders of the lake or in the old alluvial, therefore in less sterile quarters than the preceding; leaves more numerous, stout, but still of small size; (3) *intermedia*, growing on ground formed of a mixture of mud and clay, either on the borders of the lake or at a depth of from one to two metres, leaves quite intermediate in character between the previous variety and the next; (4) *elatior*, growing on the clayey depths, with long leaves. The first form is always found isolated, and as to its asexual reproduction there is nothing more to be said; but the other three, according as they are subject to more or less heat, present each three varieties characterised by the mode of reproduction. 1. *Sporifera*, isolated individuals, mostly furnished with well-developed sporangia, stem large, roots numerous, leaves large. 2. *Gemmifera*, few fertile sporangia, but most of the leaves are furnished with propagula, and these well furnished with leaves, generally dextral, stem fairly developed. 3. *Sterilis*, individuals growing in compact masses, stems and roots slender, leaves not numerous, long and narrow, fertile sporangia very rare, and more often undeveloped masses of cells or abortive propagula. It would seem as if these facts had a practical interest to the collector, who may find in them a guide as to where to look for fertile specimens.

GEOGRAPHICAL NOTES

ON Friday, April 1, the French Geographical Society held a meeting in the large hall of the Sorbonne for the reception of Dr. Lenz on his return from Timbuctoo. M. Milne-Edwards was in the chair. Dr. Lenz, as our readers know, has been very successful, although his conclusions are adverse to the construction of a railway from the Niger to Algeria throughout the Sahara. On the following morning the Society received a telegram stating that Col. Flatters had been murdered by Touaregs at some distance from the Lebhkha Amagdor. In the evening the sad news was confirmed by an official message, stating that four starving Arabs from the mission had arrived at Ouargla, and that the Khobfa had left with four hundred mehari and camel horsemen to rescue the survivors, who were besieged south of Messaguer in the Touat region proper. Happily the news of the disaster to Col. Flatters' expedition has not yet been further confirmed, and authorities in Paris are inclined to believe that it has been much exaggerated, and that the story of the four natives has many elements of suspicion about it.

DR. LENZ, in his lecture at Paris, gave some interesting details on the present condition of Timbuctoo. Its houses are built of brick, and the population is now only 20,000. It has greatly decayed, and the inhabited part of the town is surrounded by great spaces covered with ruins. There are numerous schools and rich libraries. Dr. Lenz had a cordial reception, and every night during his twenty days' stay he was present at religious conferences which the learned men of the city held with his interpreter; the commentaries on the Koran formed the only subject of conversation. Timbuctoo is united with the Niger, six miles off, by a series of lakes, formerly canals. Dr. Lenz has also made some interesting observations on the Sahara, tending to confirm the conclusions of Rholfs and other recent scientific travellers as to the variety which is to be met with in the great desert. It is really a plateau about 300 metres in altitude, no part of it being below the level of the sea. Granite hills, sandy plains, shallow lakes, fertile oases, alternate over nearly the whole surface, while beasts of prey are rarely to be met with. Dr. Lenz will contribute a full account of his journey to the Berlin Africa Society, in whose journal many of his letters have already appeared.

IT is with sincere regret that we record the death of Lieut. Karl Weyprecht, at the age of forty-three, on March 29, of consumption. Lieut. Weyprecht will be known to our readers as the discoverer, with Lieut. Payr of Franz-Josef Land, in the Austro-Hungarian Expedition of 1872–4. His observations on the aurora borealis were of especial value, and he has published several papers on the subject. He was also the originator of the scheme for establishing a series of international observations around the Pole, which is likely to be realised next year.

THE Rev. G. Brown, the well-known representative of the church militant in the South Pacific, contributes to the new number of the Geographical Society's *Proceedings* a paper descriptive of a recent journey which he has made along the coasts of New Ireland and the adjacent islands, the latter including Sandwich Island, Portland Islands, and New Hanover. Dr. Benjamin Bradshaw, who has spent some years in collecting natural history specimens in the Upper Zambesi region, also contributes a brief paper on the Chobe River, together with a sketch-map of a portion of its course, adding materially to our knowledge of the geography of this region. Mr. Crocker's paper on Saráwak and Northern Borneo, lately read before the Society, is also given, and is illustrated with a good map. The geographical notes are full of interesting matter, one giving an account, by Mr. Sibiriakoff himself, of the voyage of the *Oscar Dickson* to the Yenisei Gulf in 1880. Another furnishes conclusive proof of the usefulness of the course of scientific instruction provided by the Council for intending travellers in foreign countries. From the last note we learn that Mr. C. R. Markham, the indefatigable secretary, is preparing for the forthcoming volume of the *Journal* a sketch of the Society's work in the past fifty years.

IN the current number of *Les Missions Catholiques*, Père Richard, a missionary in Algeria, commences an account of his journey, in company with Père Kermabon, among the Tuareg-Azguer tribes of the Sahara. The object of their journey was to study this almost unknown region, and to cultivate friendly relations with the chiefs and people generally with a view to the formation of a missionary station. The more interest attaches to Père Richard's narrative, as it deals with the very region which Col. Flatters has been now exploring with the object of settling the best practicable route for the projected Trans-Sahara railway. An entirely new map of this part of Africa, based on Père Richard's notes, accompanies the number.

A LATELY-ISSUED batch of *Reports* from H.M. Consuls (Part vi. of last year) contains useful geographical information respecting portions of South America, that relating to Chili and Peru being specially interesting at the present moment.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

CAMBRIDGE.—On the 31st inst. the honorary degree of LL.D. was conferred on Prof. Helmholtz of Berlin at a special congregation.

Prof. Humphrey will take his usual May classes for the second M.B. and Natural Sciences Tripos next term, and the demonstrator will give demonstrations of the organs.

Prof. Babington will lecture on botany four times a week next term, beginning April 26. Mr. Hillhouse will give lectures on morphology and systematic botany, with practical work in the Botanical Gardens.

The Demonstrator of Comparative Anatomy will take an advanced class for instruction in the mammalia during the Easter term.

Prof. Stuart next term opens his new workshops and drawing office; in the latter instruction will be given in mechanical drawing and in machine designing, and also in graphical statics and its application to the theory of structures.

Mr. Garnett will commence an elementary course of lectures on electricity and magnetism on May 2 in the chemical laboratory of St. John's College.

The Senate has approved of Lord Rayleigh's appointment of two joint demonstrators of physics instead of one, and of the payment of a stipend of 100*l.* to each.

Mr. Balfour will lecture on the embryology of aves and mammalia next term, and have a practical class in that subject.

THE Court of Assistants of the Haberdashers' Company have have given to each of the schools under their management a cabinet of minerals, purchased from the executors of the late Prof. Tennant. The schools of the Company are at Monmouth, Newport, Hatcham, and Hoxton.

SCIENTIFIC SERIALS

Annalen der Physik und Chemie, No. 3.—Constants of elasticity of fluor-spar, by H. Klang.—On the source of beats and beat-tones in harmonic intervals, by R. Koenig.—Description of a beat-tone apparatus for lecture experiments, by the same.—Contribution to the theory of resonance, by F. Kolacek.—Some applications of the law of dispersion to transparent, semi-transparent, and opaque media, by E. Ketteler.—Researches on the spectra of gaseous bodies, by F. Lippich.—On the electromotive force of galvanic combinations formed of zinc, sulphuric acid and platinum, or copper, silver, gold, or carbon, by C. Fromme.—On a new form of the Topler mercury pump, and some experiments made with it, by E. Bessel-Hagen.—Researches on the height of the atmosphere and the constitution of gaseous heavenly bodies (continued), by A. Ritter.—On absorption of solar radiation by the carbonic acid of our atmosphere, by E. Lecher.—On the idea of galvanic polarisation, by W. Beetz.—On an artificially-formed body which takes polar directions and shows polar attractions, by W. Holtz.

Zeitschrift für wissenschaftliche Zoologie, vol. xxxv. part 2, February, 1881.—Dr. H. Adler, on the alternation of generations in the oak-gall insects, pp. 150-246, a very exhaustive treatise, with two admirably-coloured plates of the galls and one of the ovipositors, &c., of the gall-insects.—Hans Virchow, on the vessels in the eye and the appendages of the eyes in frogs, with two plates. Elias Metschnikoff, researches on the Orthonectidæ, with a plate.—Jos. Th. Cattie, contribution to a knowledge of the chorda supra-spinalis of the lepidoptera and of the central, peripheral, and sympathetic nerve systems in caterpillars, with a plate.—Dr. H. Bolau, on the pairing and propagation of a species of the genus Scyllium.—N. Kleinenberg, on the origin of the ova in Eudendrium (with a woodcut).

SOCIETIES AND ACADEMIES

LONDON

Royal Society, March 24.—"Observations on the Locomotive System of Echinodermata." (The Croonian Lecture.) By G. J. Romanes, M.A., F.R.S., and Prof. J. C. Ewart, M.D.

The principal results had reference to the tube-systems and nervous systems of the echinoderms. It was shown by injection that the ambulacral system and the so-called blood-vascular system are each closed systems, save at their common origin in the madreporic plate. Both systems communicate through this plate with the internal medium, but the one much more freely than the other, the ambulacral system being the least patent, so that it is only when a pressure of two feet is maintained for a number of hours that the injected fluid slowly permeates the stone-canal, or sand-tube, to ooze through the madreporic plate. Regarding the nervous system, it was found in Echinus that lateral branches arise from the five radial trunks to escape with the pedicels through the apertures of the pore plates. Each of these branches then courses down the pedicel, with which it escapes to the terminal sucker. From these lateral branches there also arises an intimate nerve-plexus, which covers the whole external surface of the shell, lying almost immediately beneath the surface epithelium, and extending from the shell to all the spines and pedicellariæ. In stained specimens the nerve-fibres and cells were traced to the capsular muscles at the bases of the spines, and delicate fibres were detected running up the spines and pedicellariæ, immediately below their epithelium. In the case of the pedicellariæ it appeared from several preparations that delicate fibres extended as far as the sensitive epithelial pod situated on the inner surface of each trident mandible, a short distance from the apex.

Such being the principal morphological results, the paper went on to detail a number of physiological experiments. First it was pointed out that the natural movements of echinodermata exhibit a high degree of co-ordination. Thus, for instance, all the echinoderms are able when inverted on a flat floor to right themselves. The common starfish does this by twisting the ends of two or more of its rays round, so as to bring the terminal suckers into action upon the floor of the tank, and then by a successive and similar action of the suckers further back in the series the whole ray is progressively twisted round, so that its ambulacral surface is applied flat against the floor. The rays which perform this action twist their spirals in the same direction, and by this concerted action drag the disk and the remaining rays over themselves as a fulcrum. Other species of starfish which have not their ambulacral suckers sufficiently developed to act in this way execute their righting movements by doubling under two or three of their adjacent rays, and turning a somersault over them, as in the previous case. Echinus rights itself when placed on its aboral pole, by the successive action of two or three adjacent rows of suckers—so gradually rising from aboral pole to equator, and then as gradually falling from equator to oral pole. Spatangus executes a similar manœuvre entirely by the successive pushing and propping action of its longer spines.

Experiments in stimulation showed that all the echinoderms observed sought to escape from injury in a direct line from the source of irritation. If two points of the surface are stimulated the direction of escape is the diagonal between them. When several points all round the animal are simultaneously stimulated the direction of advance becomes uncertain, with a marked tendency to rotation upon the vertical axis. If a short interval of time be allowed to elapse between the application of two successive stimuli the direction of advance will be in a straight line from the stimulus applied latest. If a circular band of injury be quickly made all the way round the equator of echinus, the animal crawls away from the broadest part of the band, *i.e.* from the *greatest amount* of injury.

The external nerve plexus supplies innervation to three sets of organs—the pedicels, the spines, and the pedicellariæ; for when any part of the external surface of echinus is touched, all the pedicels, spines, and pedicellariæ within reach of the point that is touched immediately approximate and close in upon the point, so holding fast to whatever body may be used as the instrument of stimulation. In executing this combined movement the pedicellariæ are the most active, the spines somewhat slower, and the pedicels very much slower. If the shape of the stimulating body admits of it, the forceps of the pedicellariæ seize the body and hold it till the spines and pedicels come up to assist.

And here we have proof of the function of the pedicellariæ. In climbing perpendicular or inclined surfaces of rock covered with waving seaweeds it must be no small advantage to an echinus to be provided on all sides with a multitude of forceps adapted, as described, to the instantaneous grasping and arresting of a passing frond; for in this way not only is an immediate hold obtained, but a moving piece of seaweed is held steady till the pedicels have time to establish a further and more permanent hold upon it with their sucking disks. That this is the chief function of the pedicellariæ is indicated by the facts that (1) if a piece of seaweed is drawn over the surface of an echinus this function may clearly be seen to be performed; (2) that the wonderfully tenacious grasp of the forceps is timed as to its duration with an apparent reference to the requirements of the pedicels, for after lasting about two minutes (which is about the time required for the suckers to bend over and fix themselves to the object held by the pedicellariæ, if such should be a suitable one) this wonderfully tenacious grasp is spontaneously released; and (3) that the most excitable part of the trident pedicellariæ is the inner surface of the mandibles, about a third of the way down their serrated edges, *i.e.* the part which a moving body cannot touch without being well within the grasp of the forceps.

When the forceps are closed they may generally be made immediately to expand by gently stroking the external surface of their bases.

With regard to stimulation of the spines, if severe irritation be applied to any part of the external or internal surface of an echinus, the spines all over the animal take on an active bristling movement. The tubercles at the bases of the spines are the most irritable points on the external surface.

With regard to stimulation of the pedicels, if an irritant be applied to any part of a row, all the pedicels in that row retract in succession from the seat of stimulation, but the influence does not extend to other rows. A contrary effect is produced by applying an irritant to any part of the external nerve-plexus, all the pedicels being then stimulated into increased activity. Of these antagonistic influences, the former, or inhibitory one, is the stronger, for if they are both in operation at the same time the pedicels are retracted.

Starfish (with the exception of brittle-stars) and echini crawl towards, and remain in, the light; but when their eye-spots are removed they no longer do so. When their eye-spots are left intact they can distinguish light of very feeble intensity.

Experiments in section showed that single rays detached from the organism crawl as fast and in as determinate a direction as do entire animals. They also crawl towards light, away from injuries, up perpendicular surfaces, and when inverted, right themselves. Dividing the ray-nerve in any part of its length has the effect of destroying all physiological continuity between the pedicels on either side of the division. Severing the nerve at the origin of each ray, or severing the nerve-ring between each ray, has the effect of totally destroying all co-ordination among the rays; therefore the animal can no longer crawl away from injuries, and when inverted it forms no definite plan for righting itself. Each ray acting for itself, without reference to the others, there is as a result a promiscuous distribution of spirals and doublings, which as often as not are acting in antagonism to one another. This division of the nerve usually induces, for some time after the operation, more or less tetanic-like rigidity of the rays. This operation however, although so completely destroying physiological continuity in the rows of pedicels and muscular system of the rays, does not destroy or perceptibly impair physiological continuity in the external nerve-plexus; for however much the nerve-ring and nerve-trunks may be injured, stimulation on the dorsal surface of the animals throws all the pedicels and muscular system of the rays into active movement. This fact proves that the pedicels and the muscles are all held in nervous connection with one another by the external plexus, without reference to the integrity of the main trunks.

If a cork-borer be rotated against the external surface of an echinus till the calcareous substance of the shell is reached, and therefore a continuous circular section of the overlying tissues effected, the spines and pedicellariæ within the circular area are physiologically separated from those without it, as regards their local reflex irritability. That is to say, if any part of this circular area is stimulated, all the spines and pedicellariæ within that area immediately respond to the stimulation in the ordinary way, while none of the spines or pedicellariæ surrounding the area are affected, and conversely. Therefore it is concluded that the function of the spines and pedicellariæ of localising and gathering round a seat of stimulation is exclusively dependent upon the external nervous plexus. If the line of injury is not a closed curve, so as not to produce a physiological island, the stimulating influence will radiate in straight lines from its source, but will not irradiate round the ends of the curve or line of injury.

Although the nervous connections on which the spines and pedicellariæ depend for their function of localising and closing round a seat of stimulation are thus shown to be completely destroyed by injury of the external plexus, other nervous connections, upon which another function of the spines depends, are not in the smallest degree impaired by such injury. This other function is that which brings about the general co-ordinated action of all the spines for the purposes of locomotion. That this function is not impaired by injury of the external plexus is proved by severely stimulating an area within a closed line of injury on the surface of the shell; all the spines over the whole surface of the animal then manifest their bristling movements, and by their co-ordinated action move the animal in a straight line of escape from the source of irritation.

We have, therefore, to distinguish between what may be called the local reflex function of the spines, which they show in common with the pedicellariæ, and which is exclusively dependent upon the external plexus, and what we may call the universal reflex function of the spines, which consists in their general co-ordinated action for the purposes of locomotion, and which is wholly independent of the external plexus. Evidently, therefore, this more universal function must depend upon some other set of nervous connections (which, however, the authors were not able to detect histologically), and experiment shows that these, if present, are distributed over all the *internal* surface of the shell. For if the internal surface be painted with acid, or scoured out with emery paper and brick-dust, the spines and pedicellariæ, after a short period of increased activity or bristling, become perfectly quiescent, lie flat, and lose both their spontaneity and irritability. After a few hours, however, the spontaneity and irritability of the spines return, though in a feeble degree, and also those of the pedicellariæ in a more marked degree. These effects take place over the whole external surface of the shell, if the whole of the internal surface be painted with acid or scoured with brick-dust; but if any part of the external surface be left unpainted or unscoured, the corresponding part of the external surface remains uninjured. From these experiments it is concluded:—(1) that the general co-ordination of the spines is wholly dependent on the integrity of the hypothetical internal plexus; (2) that the hypothetical internal plexus is everywhere in intimate connection with the external, apparently through the calcareous substance of the shell; and (3) that complete destruction of the former, while profoundly influencing through shock the functions of the latter, nevertheless does not wholly destroy them.

Echini may be divided into pieces, and the pedicels, spines, and pedicellariæ upon these pieces will continue to exhibit their functions of local reflex irritability, however small the pieces may be. If an entire double row of pedicels be divided out as a segment and then placed upon its aboral end, it may rear itself up on its oral end by the successive action of its pedicels, and then proceed to crawl about the floor of the tank. We have therefore to meet the question: Is the action of the ambulacral feet in executing these righting movements of a merely serial kind, *a*, *b*, and *c* first securing their hold on the tank floor, owing to the stimulus supplied by contact, and then by their traction tilting over the globe, till *d*, *e*, and *f* are able to touch the floor, and so on; *or* does the righting action depend upon nervous co-ordination? Experiments showed that both principles are combined, the action of the pedicels being serial, but also assisted by nervous co-ordination. This conclusion is sustained by the experiment of shaving off the spines and pedicels over one-half of one hemisphere, *i.e.* the half from the equator to the oral pole. When then inverted and forced to use their mutilated pedicel-rows, the echini reared themselves upon their equators, and then, having no more pedicels wherewith to continue the manœuvre, came to rest. This rest was permanent, the animal remaining, if accidents were excluded, upon its equator till it died. The question then here seems to resolve itself simply into this: Is the mechanism of the pedicels so constructed as to insure that their serial action shall always take place in the same direction? For if it can be shown that their serial action may take place indifferently in either direction it would follow that the persistency with which the partly shaved echini continue reared upon their equators, is the expression of some stimulus (such as a sense of gravity) continuously acting upon some central apparatus, and impelling the latter to a continuous, though fruitless, endeavour to co-ordinate the absent pedicels. If the pedicels are able to act serially in either direction, there is no more reason why a partly-shaved echinus should remain permanently reared upon its equator, than that it should remain permanently inverted upon its pole; and therefore the fact that in the latter position the pedicels set about an immediate rotation of the animal, while in the former, and quite as unnatural position, they hold the animal in persistent stasis—this fact tends to show that the righting movements of the pedicels are something more than serial. Thus the whole question as between the two hypotheses amounts to whether the pedicels are able to act serially from oral to aboral pole. Observation showed that they are so, for echini spontaneously rear themselves from their normal position on the oral pole, to the position of resting upon their equators. Further, as additional evidence that the righting movements are at least assisted by some centralising influence, is the fact that when the evolution is nearly completed by the pedicel-rows engaged in executing it, the lower pedicels in the other rows become strongly protruded and curved downwards, in anticipation of shortly coming into contact with the floor of the tank.

Removing the pentagonal nerve-ring has no effect at all upon the pedicellariæ or on the local reflex action of the spines; both these organs continue to close round an instrument of stimulation. But the general co-ordination of the spines is totally and permanently destroyed—their bristling movements no longer serving to convey the animal from a source of irritation, but only causing the animal aimlessly to gyrate. This shows that the pentagonal nerve-ring has in large measure the function of a nerve-centre. The same thing is shown by the effect of its removal upon the righting movements. These are gravely impaired, though not wholly destroyed—four in twelve specimens so mutilated continuing able to right themselves. These facts, together with the fact of separate segments of echinoderms behaving in all respects like entire animals, prove that the nervous system is in function, as in structure, everywhere both central and peripheral; although the impairing influence exerted on the co-ordination both of the spines and pedicels by removal of the pentagonal ring, proves that this ring has a more centralising function than any other part of the nervous system.

Chemical Society, March 30.—Anniversary Meeting.—The president, Prof. Roscoe, gave his annual address. He congratulated the Society on its flourishing condition. At no period in its history had the number of Fellows been so large, whilst the number of papers read during the past twelve months had increased both in number and in importance. The research fund founded by Dr. Longstaff had done much for the progress of science. The President touched upon the more important discoveries of the year. The supposed decomposition of chlorine and iodine by Victor Meyer has been found to be capable of another explanation. The solar and stellar evidence of the decomposition of metals accumulated by Mr. Lockyer has not yet found general acceptance by chemists. Capt. Abney and Col. Festing have discovered that the organic radicals methyl, ethyl, &c., give characteristic absorption spectra in the infra-red part of the spectrum. Baeyer has succeeded in preparing indigo artificially, and its manufacture on the commercial scale is rapidly progressing. The Society has lost by death ten Fellows, including Sir B. Brodie, Dr. Stenhouse, Prof. W. H. Miller, and Mr. Tennant.—The Longstaff medal was presented to Prof. Thorpe of the Yorkshire College, Leeds, as the Fellow who had done the most to promote chemical science by research.—The reports of the President and Treasurer were received and adopted, and the Officers and Council elected for the ensuing year. President, H. E. Roscoe. Vice-Presidents: F. A. Abel, Warren De La Rue, E. Frankland, J. H. Gladstone, A. W. Hofmann, W. Odling, Lyon Playfair, A. W. Williamson, A. Crum Brown, J. Dewar, J. H. Gilbert, A. V. Harcourt, J. E. Reynolds, J. Young. Secretaries: W. H. Perkin, H. E. Armstrong. Foreign Secretary, Hugo Müller. Treasurer, W. J. Russell. Council: F. D. Brown, M. Carteighe, H. McLeod, G. H. Makins, E. J. Mills, W. C. Roberts, C. Schorlemmer, J. M. Thomson, C. M. Tidy, W. Thorp, T. E. Thorpe, R. Warington.

Physical Society, March 26.—Prof. Fuller in the chair.—New member Mr. Lewis Wright, author and editor.—Dr. James Moser read a paper on electrostatic induction, especially relating to the branching of the induction in the differential inductometer and in the electrophorus. The author's experiments bore out the hypothesis of induction as enunciated by Faraday. Prof. Ayrton suggested the importance of adding guard-rings to the small plates of the five-plate inductometer or balance, since without these mathematical calculations could not be accurately applied, and the experimental determination of specific inductive capacity would be doubtful. Dr. Moser pointed out that though the theory was not absolutely correct it lay with the experimenter to get results very approximately correct.—Prof. Reinold, one of the secretaries of the Society, read a paper by himself and Prof. Rückert on the electrical resistance of liquid films with a revision of Newton's scale of colours. The experiments were in continuation of those published by the authors in 1877. Their object was to determine whether a film thinning under the action of gravity gave any evidence, by a change in its specific resistance, of an approach to a thickness equal to twice the radius of molecular attraction, and also to devise a method of finding the amount of water which might be absorbed by or evaporated from it. The thickness of the films was determined from their colour by means of two beams reflected from different mirrors on them.—Newton's scale of colours was revised by observations on Newton's rings, and partly by more than 2000 observations on the rings themselves. The thicknesses determined by direct observations on Newton's rings and those in the corrected table rarely differ by 1 per cent., while Newton's scale in parts differs from both by as much as 10 per cent. of the thickness. The films were formed from a solution of oleate of soda in glycerine, with a little nitrate of potash added to increase their electric conductivity. They were blown in a glass case from which the outer air could be excluded. Precautions were taken to keep the air in contact with the films inside the case at a proper humidity. These consisted in placing dishes containing the solution at the bottom of the case and suspending within it sheets of blotting-paper, the lower edges of which dipped into the liquid. A hair hygrometer indicated changes in the humidity of the interior. The resistance of the films was measured by piercing them with gold wires, which were connected with the electrodes of a quadrant electrometer. The resistance of the film between the needles was calculated by comparing the deflection caused by the difference of potential of the two wires when a current was passing through the film with that produced by the difference of potential above and below a known resistance placed in the same circuit. The specific resistance of the liquid from which the films were formed was measured by a method identical in principle with the above. The liquid was contained in a glass tube with turned-up ends. Platinum wires were cemented into small holes drilled in the straight part of the tube, and their difference of potential compared with that of two points in the same circuit separated by a known resistance. This method has the great advantage of getting rid of any difficulties connected with polarisation. Test experiments on sulphuric acid proved the method to give results agreeing with those of Kohlrausch, who employed alternating currents and Wheatstone's bridge. The results of the experiments may be summed up as follows:—It is difficult to form a soap film under conditions precluding a slight evaporation or absorption of water, but the more nearly these conditions are attained the more closely does the specific resistance of the film agree with that of the liquid in mass. The films observed under the most favourable conditions obeyed Ohm's law with great accuracy, and much better than the others. The films indicate no approach to a thickness equal to the diameter of molecular attraction. A soap-film may even in an inclosed space readily loose 23 out of 57·7 volumes of water contained in every 100 volumes of the solution, when special precautions are not taken to maintain the surrounding space in a constant hygrometric condition. Prof. Ayrton suggested that in measuring the liquids and film the distance between the electrodes should be varied. Prof. Guthrie pointed out that the results of Prof. Reinold and Kohlrausch agreed with his own in showing that the conductivity of liquids obeyed Ohm's law.

Geological Society, March 23.—Robert Etheridge, F.R.S., president, in the chair.—Rev. Daniel Dutton and Capt. George Ernest A. Ross were elected Fellows of the Society.—The following communications were read:—The Upper Greensands and chloritic marl of the Isle of Wight, by C. Parkinson, F.G.S. In this paper the author described the Upper Greensand as exposed at St. Lawrence and along the Undercliff. At the base of the St. Lawrence Cliff there are hard bands of blue chert from which astaciform Crustacea have been obtained; and quite recently, in a large boulder of the same material lying on the beach, there were found the remains of a Chelonian, referred by Prof. Owen to the family Paludinosa, and named by him *Plastremys lata*. The presence of these freshwater organisms was thought to imply a connection with the Wealden continent. The chert-bed, 2 feet thick, was regarded by the author as marking the boundary between the Gault and the Greensand. Above it the author described 56 feet of compact red and yellow sands, of which the first 20 feet are unfossiliferous, the upper 32 feet show traces of organic remains; between them there is a fossiliferous zone 4 feet in thickness, containing *Ammonites inflatus*, *A. auritus*, and species of *Panopæa*, *Cucullæa*, *Arca*, and *Trigonia*, and immediately below this a separate band containing an undetermined species of Ammonite. These sands are followed by 38 feet of alternate beds of hard chert and coarse greensands, having at the bottom 6 feet of inferior building-stone surmounted by 5 feet of freestone. The latter contains *Ammonites rostratus*, and the cherts various fossils, chiefly bivalves. *Clathraria Lyelli* also occurs at this level. Above the greensands come 6 feet of chloritic marl: the upper 3½ feet fossiliferous, with a base of hard phosphatic nodules containing crushed specimens of *Pecten asper*; the lower 2½ feet compact, with darker grains and few fossils. The author compared the sections of this series given by Capt. Ibbetson and Dr. Barrois; his own views closely correspond with those of the latter writer.—On the flow of an ice-sheet, and its connection with glacial phenomena, by Clement Reid, F.G.S. The author considers that the boulder-clays have been formed beneath an ice-sheet, and consequently there must have been formerly a huge mass of ice, which would have to flow 500 miles on a nearly level surface, and then to ascend a gentle slope for nearly another 100 miles. He does not think a great piling up of the ice at the North Pole can be assumed to account for this motion. This he explains by the gradual passage of the earth's heat through the mass of ice, raising the temperature of the whole instead of liquefying the surface-layer. As the heat passes upwards it raises the temperature of a particular layer, causes it to expand, and so to put a strain upon the layer above, and then to rupture it. The broken part spreads out, reunites by regelation, and then, receiving the heat from the layer below, again expands and ruptures the layer next above. Thus the movement is from the base upwards rather than from the surface downwards. The author estimates that the ice-sheet in Norfolk was only about 400 feet thick, because boulder-clay does not appear above that level, but only coarse boulder-gravel; in North Yorkshire it extends up to about 900 feet. The author considers that the shell-beds of Moel Tryfaen were not deposited under water, but thrust up-hill by this advancing ice-sheet.—Soil-cap motion, by R. W. Coppinger, communicated by the president. The author described numerous cases in Patagonia where the stumps, &c., of trees are to be seen in the marginal waters of the sea and of lakes. These, together with stones and rocks, sometimes simulating perched blocks, he considers to have been brought down by the motion of the soil-cap—a thick spongy mass resting upon rock often worn smooth by the action of ice, and so sliding down the more easily under the influence of vegetation. The appearances are not unlike those due to subsidence; but he points out that all the evidence is in favour of recent upheaval, instead of subsidence.

Victoria (Philosophical) Institute, April 4.—Prof. Balfour Stewart, F.R.S., read a paper on the visible universe, which he described in general terms, and then sought to trace its history back, giving a passing sketch of the views of the theologian on the one hand and the materialist on the other, through its many forms to its first logical origin. A discussion ensued, which was taken part in by several who had been specially invited, the question being treated from the scientific and the metaphysical point of view.

PARIS

Academy of Sciences, March 28.—M. Wurtz in the chair.—On account of the death of M. Delesse, the Academy went early into Secret Committee.—The following papers were communicated:—On the heats of formation of diallyl, chloro-compounds, and aldehyde, by MM. Berthelot and Ogier.—Remarkable case of globular lightning; diffuse flashes near the surface of the ground, by M. Trécul. On August 25, 1880, during a thunderstorm, and in full daylight, he saw a very brilliant body, slightly elongated (say 38 to 40 ctm. long by 25 ctm. broad), and with conical ends, pass from one part of a dark cloud to another; and before disappearing, a small part of its substance fell, *as if having weight*, and gave a luminous vertical track with reddish globules at the sides. It divided in falling, and disappeared a little above the houses. The other phenomenon M. Trécul has often noticed in thunderstorms, viz., a band of feeble light, momentarily illuminating a street and reaching right across it, or only part of the width. The author adds some reflections on the phenomena he described on August 23, 1880.—On the representation of numbers by forms, by M. Poincaré.—On a class of linear differential equations, by M. Halphen.—On the reduction of positive quaternary quadratic forms, by M. Charve.—New researches on the winter egg of phylloxera; its discovery at Montpellier, by M. Mayet. To find the winter egg in Languedoc, he recommends searching on young American vines of the species *Riparia*, and only where galls are observed on the leaves; further, only raising the bark of two or three years (preferably the former).—Attempted application of the principle of Carnot to electro-chemical actions, by M. Chaperon.—On the construction of photophonic selenium-receivers, by M. Mercadier. These consist of two strips of brass (1 to 4 or 5m. long) separated by two strips of parchment paper, the whole wound in a close spiral, and held in position by two wooden pieces with screws. The arrangement is heated to the melting-point of selenium, and a pencil of selenium passed over the surface. These receivers are continuous, are easily made and repaired, have the same properties as the discontinuous ones, &c. It is possible to give them a very variable resistance, from 8000 to 200,000 ohms., without their ceasing to act well. A large number arranged in series or in surface may be placed in the battery circuit, and many persons enabled to hear photophonic effects at once. In one of M. Mercadier's arrangements the sounds were heard at 2 or 3 m. distance.—On the causes of disturbance of telephonic transmission, by M. Gaiffe. He notices the disturbing effects of friction of wires with each other, and of vibrations caused by wind or otherwise.—On the preparation and the properties of protochloride of chromium, and of sulphate of protoxide of chromium, by M. Moissan.—On phosphoplatinic combinations, by M. Pomey.—Products of action of hydrochlorate of ammonia on glycerine, by M. Etard.—Irian grafts; pathogeny of cysts and epithelial tumours of the iris, by M. Masse. He has found (with rabbits) that small pieces of the conjunctiva or of skin introduced into the anterior chamber of the eye, through an incision made in the cornea, are pretty easily grafted on the iris. After some time the graft takes the form of a fine small pearl, very like the cysts or epithelial tumours which sometimes appear on the human iris after wounds of the cornea. The grafts with skin consist of a thick layer of pavement epithelium, with connective tissue beneath united to that of the iris. In the centre of the grafts of conjunctiva a true cystic cavity is developed. Hairs with their follicles may also be grafted on the iris. Rothmund's theory of the cause of cysts and tumours of the iris (pieces of skin, &c., carried through a wound) is apparently verified by these researches.—On the nature and order of appearance of old eruptive rocks observed in the region of volcanoes with craters of Puy-de-Dôme, by M. Julien.

VIENNA

Imperial Academy of Sciences, March 31.—V. Burg in the chair.—The following papers were read:—H. Wild, on the temperatures of the Russian Empire.—Dr. H. Goldschmidt, on the action of molecular silver on carbon chlorides.—Dr. F. Hocevar, on some experiments made with a Holtz's machine.—R. Andreasch, synthesis of methylated parabanic acid, of methyl thioparabanic acid, and of thiocholestrophane.—Dr. Emil Holub and A. v. Pelzeln, ornithological results of Holub's voyages in South Africa.—Kachler and Spitzer, on Borneol- and camphor-carbonic acid.—Max Gröger, on sulphochromates.—Alb. Cobenzl, contribution to the dissociation of tungsten from antimony, arsenic, and iron, with an analysis of a so-called pseudo-meteor.

THURSDAY, APRIL 14, 1881

THE NEW MUSEUM OF NATURAL HISTORY

THE great terra-cotta building facing Cromwell Road, South Kensington, and occupying the site of the old 1862 Exhibition, about which for the past twelve months public curiosity has been raised, is about to draw up its blinds, and to offer a part of its extensive galleries for inspection on Easter Monday.

It is no secret that for thirty years past the accommodation in the British Museum, Great Russell Street, Bloomsbury, "both for man and beast," had become too restricted, and the necessity for a larger building was keenly felt. As usually happens in such cases, the most adventurous and energetic officer was the first to obtain for his department what he required, namely, *more room.*

Sir A. Panizzi (then Keeper of Printed Books) projected, shortly after the 1851 Exhibition, his scheme for a great central Reading-room and Library, and some five years after witnessed its completion. Some years later on, the Department of Antiquities, represented by Mr. C. T. Newton, C.B., also obtained an addition to its galleries on the western side, and still more recently on the southern side, next the great Entrance Hall.

Great praise is due to Mr. Bond, the present Principal Librarian, for putting an end to the use made of the fine colonnade in front of the British Museum, which for twenty-five years was blocked by antiquities covered in with a row of extremely unsightly and incongruous wood and glass sheds. These are now happily removed. The Department of Prints and Drawings lacking a gallery, obtained possession of the "King's Library" floor on the east side for an exhibition space; and even the conservative Coin Department likewise laid out for the public a few show-cases here of coins and medals.

But, like the clothes of the rising son, in the old caricature, the collections everywhere had outgrown their receptacle, and none more so than the departments of Natural History. Scientific men were however not unanimous, and a fierce controversy was carried on in 1858–59 as to the relative merits of enlargement on the old site, or dismemberment. Finally, after a Committee of the House of Commons had taken evidence upon the subject, the removal of the Natural History Collections was decided upon by Government.

But the death of the Prince Consort, the delay of the House of Commons to vote the necessary funds, the retirement of Sir A. Panizzi from the post of Principal Librarian, the discussion of rival plans, the inevitable delays about the completion of any Government building, caused twenty years to pass before the plans of the chosen architect, Mr. Alfred Waterhouse, were realised in a solid and material form.

Midsummer, 1880, barely sufficed to enable the Office of Works to certify to the fulfilment of the Contractor's work and to hand over the building to the Trustees ere collections began to be moved in.

Nine months only have elapsed, and already three Departments, viz. Botany, Mineralogy, and Geology, have transferred their entire collections from the old to the new building. But less than half the cases for the entire building have yet been supplied, and everywhere the labour of completing the structure as well as fixing cases and fittings is being busily carried on. Under these circumstances it seems not improbable that two years may elapse before the Zoological Collections will be removed and housed in their new quarters.

Let us now take a glance at what Mr. Sala styles "this Temple of Nature." The architectural character of the new building may be termed "Decorated Norman," but it is in many respects unique, especially as regards the treatment of its details. The first, or "ground-floor," is above the road, and the entrance is approached by a broad flight of steps and by a sloping carriage-drive. The entire structure is of brick cased with terra cotta, the doorways and the windows being ornamented with columns designed from natural history objects, chiefly from plants. Reproductions of various animals are also introduced. The main part of the building has a tower at each end, and there are also two central towers rising on either side of the entrance. The south front of the building is about 650 feet in length, running due east and west, and is three storeys high, in addition to the basement, which is above the level of the garden in which the building stands.

The Central Hall or "Index Museum" runs from south to north; it is 150 feet long, 97 feet wide, and about 60 feet high; along its two sides are twelve arched recesses. At the north end is a wide and handsome staircase which branches off right and left to the open corridors or side aisles on either hand upon the first floor. This Central Hall is more richly decorated than any part of the building. The floor of mosaic work, where Italian marble is employed, has been skilfully laid by Italian workmen. The side aisles or corridors look out into the Central Hall by an open balustrade surmounted by large arches, each containing three smaller ones, the centre one being much higher than the others. The pillars supporting these are ornamented with a nearly natural treatment of *Lepidodendron;* in some few cases animals, monkeys, birds, &c., are introduced. The decoration of the ceiling is very effective. A double row of panels runs along the central line, and on either side of this, between the iron girders and following the curve of the roof, are panels in groups of six; these are ornamented with representations of different species of trees, shrubs, and flowering-plants treated somewhat conventionally. That portion of the ceiling over the main body of the hall is decorated with trees, each of which occupies six panels, as they can be most easily seen from the floor and need bold treatment. At the south end, where the ceiling is over a staircase and landing leading from the first to the second floor, each panel contains but one species: the eye being nearer to the ceiling greater detail has been introduced. The effect of the whole is very fine, and as the hall is at present without any cases or specimens, it has the general appearance of a cathedral. This idea is further heightened by the introduction of a triforium, though this has been added merely for effect, the passages being interrupted.

Beyond the Index Museum is a smaller and less lofty hall quite divided from it, save by two arched entrances, 97 feet by 70 feet, intended to hold the British Zoological Collection. It is surrounded by arched recesses similar to those in the Index Museum. In this hall the decoration of the ceiling is also botanical, but all the species selected are of British plants. Underneath the staircases and in the recesses a plain light colour is introduced, relieved with gilding. The decorations of the saloons or galleries are much simpler. The columns throughout are of terra cotta, ornamented with natural history objects.

The other parts of the building consist of series of galleries running north from the front or main building, but only one storey above the basement. The rooms on each floor, at the end of the long front galleries and under the two end towers, are called pavilions. The main or front galleries facing Cromwell Road are lighted by windows north and south. The Central Hall or Index Museum, the Hall for British Zoology, and all the other galleries of one storey high running north, are lighted by skylights. The Index Museum has however, in addition to its roof-lights, windows in the corridors on either side.

The distribution of the space available is as follows:—The long galleries to east of the entrance on the ground-floor, and all the galleries from it, running north, are devoted to Geology and Palæontology. The first floor above the Geological Gallery is devoted to Mineralogy, and the floor above this to Botany. The whole of the galleries on the west side of the building are given to Zoology. The Index Museum, according to Prof. Owen, is designed to present to the public, in a series of twelve recesses, typical examples of all the collections—in fact, an epitome of the whole animal, vegetable, and mineral kingdoms. Prof. Owen further desires to show the marvels of nature and objects of special interest, as exemplifying size, &c., such as whales, basking sharks, &c. These are to occupy the centre of this great hall. Passing to the right from the Index Museum (on the ground floor) we enter the South-East Gallery of the Geological Department (233 feet in length by 50 feet in width, and lighted by windows on either side), at the east end of which is the Pavilion, a room 60 feet by 40 feet. These two galleries are entirely devoted to the exhibition of the fossil Mammalia and Birds, and are provided with pier-cases and table-cases. The larger objects are arranged down the centre of the floor.

The cases on the left hand are nearly all occupied with the remains of *Proboscidea*. Commencing with the *Deinotherium* from Epplesheim, with its tusk-like incisors in the lower jaw, we pass to the *Mastodons*, in which, as a rule, the tusks are developed in the upper jaw and not in the lower. But to this there are exceptions; one American Mastodon having immature tusks in the lower jaw, and the *Mastodon angustidens*, from Sansau in France, having tusks in both the upper and the lower jaw.

Nearest the entrance door, in the centre of the gallery, is placed the entire skeleton of the great American mastodon from Ohio, which must have been considerably larger in bulk than that of any existing elephant; on the same stand is placed the head of a young Mastodon from New Jersey, and in front of it the skull and lower jaw of the South American Mastodon from Chili. It is interesting to notice that both the mastodon and elephant had overspread the North and South American continents in Tertiary times, and they were equally widely distributed over the European and Asiatic continents; their modern representatives however are confined, the one to the continent of Africa, the other to India, Ceylon, &c. The tusks of some of the old fossil elephants were of enormous proportions: witness the head of *Elephas ganesa* from the Siwalik Hills, India, and that of the mammoth (*Elephas primigenius*) from the valley of the Thames, near Ilford. Large numbers of elephant remains have been dredged up year by year for the past sixty years off the Dogger Bank and the Norfolk coast, affording good evidence that in comparatively modern times the North Sea was a great valley watered by the Rhine, Moselle, &c., giving pasturage to vast herds of deer, bison, oxen, and elephants; where also the rhinoceros and the hippopotamus found a pleasant home. A goodly series of the remains of these animals from British and Continental localities may be seen in this gallery, and also abundant evidence of the old Siberian mammoth and rhinoceros, both of which have been met with "in the flesh," frozen solid in mud and ice. Here are also exhibited an interesting series of the "pigmy elephant" from Malta, brought home by Admiral Spratt, R.N., and Prof. Leith Adams. By far the larger collection of elephant remains are those from the Siwalik Hills, India, obtained by Col. Sir Proby T. Cautley and described by Dr. Hugh Falconer, F.R.S. The "gigantic Irish deer" (*Megaceros Hibernicus*) forms a prominent and striking object in the centre of the gallery, with its branching antlers 10 feet across, a noble prey for its contemporary, the "sabre-toothed tiger" (*Machairodus latidens*), remains of both animals having been found together in Kent's Cavern, Torquay.

Passing by the cases of carnivora, of thick-skinned animals, and of ruminants, our attention is next arrested by the great bandless armadillo from South America (*Glyptodon*), whose carapace is bigger than a hogshead, and which measured nearly 12 feet from its head to the tip of its armour-plated tail.

Another of these extinct Edentates from the La Plata, the *Megatherium Americanum*, stands in the centre of the floor of the Pavilion. This colossal "ground-sloth" measured 18 feet in length, its bones being more massive than those of an elephant. It displays in every part of its framework enormous strength and weight combined, sufficient to break down or uproot the trees, upon the leaves and succulent branches of which it fed, like its pigmy modern congener *Bradypus tridactylus*, which leads an arboreal existence, climbing from bough to bough in the Brazilian forests.

The extinct Marsupial fauna of the great island continent of Australia is here well represented by the huge *Diprotodon*, the *Nototherium*, and the anomalous *Thylacoleo*. Of the Wombat family only a small living representative is known, of burrowing habits, found in Tasmania; formerly they were abundant on the continent of Australia, varying in size from a marmot to that of a tapir. The largest of these are called *Phascolomys magnus* and *P. gigas*.

The collection of remains of the great extinct wingless birds of New Zealand forms a very interesting feature of this gallery. The tallest skeleton measures 12 feet in height, and the smallest not more than 3 feet.

Madagascar had also its extinct wingless birds, similar to those of New Zealand. Eggs of both the *Dinornis* and the *Æpyornis* may here be seen, one of the latter having a capacity of two gallons.

The rarest of all avian fossils is still the *Archæopteryx* *macrura* from the lithographic stone quarries of Solenhofen. Fortunately for the incredulous a second specimen has recently been obtained, and is preserved in the Berlin Museum. Its lacertilian affinities are well shown in its long and rat-like tail of twenty vertebræ and its three-clawed digits in each fore-limb (or wing?). The head of the Berlin specimen is too obscure to give evidence of teeth, but its beaked jaws are clearly seen in the photograph. The original specimen described by Prof. Owen is headless.

Running parallel with the south-east gallery is the Reptilian Gallery, 225 feet in length and 21 feet wide, the south wall of which is entirely occupied with the grand series of sea-lizards, the *Ichthyosauria* and *Plesiosauria*, once so abundant in the old Liassic seas of Europe, and the fossil remains of which have even been brought home from the Arctic regions and from New Zealand. The largest of the long-necked Plesiosaurs measures 22 feet in length and 14 feet across its extended paddles. The largest Ichthyosaur was probably even bigger than this. On the north side are displayed the remains of the great land lizards, *Dinosauria*, of which the *Iguanodon* is perhaps the most familiar example. A more recent discovery is that of the *Omosaurus* from the Kimmeridge Clay of Swindon, Wilts, the femur of which is more than 4 feet in length, and the humerus nearly 3 feet long, and enormously broad; they were probably to some extent amphibious in their habits, but their limbs were well fitted for progression on the land.

Numerous other fine Dinosaurian remains are to be seen in these cases. As we do not know the teeth of many of these huge reptiles, we are unable to speak positively as to their habits; but it is certain that from the Trias to the Chalk two groups have existed side by side, one having a carnivorous dentition and the other being herbivorous. The *Teratosaurus* of the Trias of Stuttgart and the *Lycosaurus* and *Cynodraco* from the Cape, the *Megalosaurus* of the Stonesfield Slate and Wealden were all carnivores, whilst the *Iguanodon*, *Acanthopholis*, *Scelidosaurus*, and the South African genera *Anthodon* and *Nythosaurus* were all vegetable-feeders. But of *Polacanthus*, *Omosaurus*, *Hylæosaurus*, and *Cetiosaurus* we have no direct dental evidence. No doubt, as amongst the mammalia at the present day, the majority were vegetable-feeders and the minority were predacious in habit.

In this gallery are also exhibited the flying lizards of the Secondary Rocks, most of which have been found in the lithographic stone of Solenhofen and a few in our own Lias, Stonesfield Slate Chalk, and Greensand.

If Comparative Anatomy may be trusted, some of the Pterodactyles from the Chalk of Kent give evidence of a flying lizard having probably an expanse of wings of from eighteen to twenty feet.

An Australian novelty is the great horned lizard (*Megalania prisca*), 14 feet or more in length, with nine horn-like prominences on its skull and an armour-plated tail similar to that of the *Glyptodon*.

The Triassic reptiles from South Africa form a singular addition to our knowledge of ancient life forms long since passed away. They are comprised in Prof. Owen's groups of *Anomodontia* and *Theriodontia*.

Among the fossil Chelonians we have representatives of both the marine turtles, the fresh-water *Trionyx* and *Emys*, and the gigantic and lesser land-tortoises. Of the first of these are the remains of the great *Chelone Hofmanni* from Maestricht, and the *Chelone gigas* from the London Clay of Sheppey, larger by far than the "loggerhead" turtle of the present day. Of the last (land-tortoises) may be mentioned the *Colossochelys atlas* from the Siwalik Hills, which out-rivals the *Glyptodon* in bulk.

Three wide and four narrow galleries built at right angles to the Reptile Gallery, each 137 feet in length, the former being 40 feet and the latter 20 feet in width, are placed alternately, running due north and south, and lighted from above. These fine rooms afford ample accommodation for the fossil fishes, all the classes of the Invertebrata (mollusca, brachiopoda, bryozoa, insecta, myriopoda, arachnida, crustacea, annelida, echinodermata, corals, foraminifera, sponges, and plants). These long galleries, or annexes, and the ones corresponding with them on the western side, are built upon the plan recommended by the Royal Commission of 1874. But the wall-cases are all constructed to open in front, *not at the back* of the case, as suggested. They are however the best-lighted galleries in the whole building, and best suited for museum purposes. Two of these large galleries are not yet ready for occupation, and the third is under arrangement; the narrow galleries give space for a library, special reference collections, a stratigraphical series, and working-rooms for students.

In the basement are twelve workshops, studies, and store-rooms devoted to Geology, ten studies, work-rooms, and laboratories to Mineralogy, and three to Botany.

The Mineralogical Gallery, on the first floor, which corresponds with the South-East Gallery and Pavilion in extent, is also lighted by windows on either hand; it has seven wall-cases, two at each end of the long gallery and three in the Pavilion, the collection being mainly contained in forty-eight large table-cases.

These table-cases form a long row on either hand, commencing at the entrance of the gallery, the odd numbers being on the left hand and the even on the right. Each of the first forty cases nearly equals in capacity two of the cases in the old mineral gallery; we have therefore a much more magnificent display than could have been attempted formerly, when the minerals and fossils were all crowded together in the same gallery.

The collections of naturally and artificially-prepared crystals occupy two large cases in the Pavilion, whilst two of similar construction are filled with meteorites. The great Cranbourne Meteorite and that from Mexico occupy special cases on the east side. In the wall-cases are arranged the extensive collection of rocks, two cases being devoted to polished marbles.

The general plan pursued in the arrangement remains the same as in the old Museum gallery, so that by using boxes corresponding to one quarter of a table-case, the minerals were transported from the old to the new building and re-arranged in an incredibly short space of time, and with the exception of the Pavilion and the wall-cases have long been ready for exhibition.

In the Botanical Gallery the glazed cases for the exhibition of specimens project from the wall into the room like square shop-fronts, having three plate-glass sides. The whole of the glass is permanently fixed, except one division forming the door. A "cell" inside, inclosed by curtains, gives access to the specimens; by this contrivance it is hoped that the dust will be excluded to a great extent.

Accommodation for large specimens, as, for example, portions of stems and sections of various kinds of wood, such as oak, walnut, pine, cedar, and other dicotyledons, and trunks of palms, cycads, tree-ferns, bamboos, and other striking examples of the vegetable kingdom, is provided for by three tall metal and glass cases 14 feet high, occupying the floor-space in the centre of the gallery.

One-half of the main gallery is partitioned off from the public room, and fitted up with cabinets for the reception of the *Herbarium*, the nucleus of which was obtained by Sir Joseph Banks and Solander in their voyage round the world with Captain Cook. This first series of cabinets is entirely occupied with the flowering plants, which are all fastened on single sheets of paper. The Pavilion contains similar cabinets for the reception of the British plants and Filicinæ, whilst the room above in the tower is intended for the Cryptogamia. Down the centre of the large room are cabinets fitted to receive the great collection of fruits and seeds, each being placed near its appropriate family in the Herbarium on either side. These inner rooms, with the valuable library attached to them, are of course only available for purposes of study, but are always accessible to the botanical student and worker.

On the south-west side of the Index Museum, the gallery on the second floor which corresponds with that appropriated to Botany is designed to contain the great collection of Recent Osteology; that on the first floor is to be devoted to stuffed animals, and the front ground-floor gallery to birds. The eight galleries in rear of the main building on the west side will be appropriated to the Reptilia, Fishes, and Invertebrata. The collections preserved in spirits are to be placed in a special building at the north end of these galleries. The basement on the west side contains sixteen studies and work-rooms and a large open space well fitted for workshops and stores.

The Assistant-Secretary (Mr. J. T. Taylor) is provided with offices adjoining the Board Room on the first floor above the British Zoological Hall. The Superintendent, Prof. Owen, C.B., and the Keepers of Geology (Dr. H. Woodward, F.R.S.), of Mineralogy (Mr. L. Fletcher, M.A., F.G.S.), and of Botany (Mr. W. Carruthers, F.R.S.), have each a study in the central towers on either side the entrance.

There are a few scientific men who still strongly protest against the removal of the Natural History Collections from the old to the new building, on the ground that the locality is inconveniently far west, and that they are thereby precluded from using the Collections so freely as heretofore. One of the strong grounds for protesting against the removal has been the serious inconvenience arising from the separation of the collections from the great National Library. This injury will however be gradually removed by the formation of a new Natural History Library in the present building, a vote for which has been already taken.

The comparatively small band of scientific men who use the Natural History Museum for purposes of special work and study, would always do so wherever the collections happened to be located.

So too the holiday-makers, who come to the Museum merely to be amused, will as willingly travel to South Kensington as to the Regent's Park Zoological Gardens, or to the Crystal Palace.

Undoubtedly the highest aim and use of our great National Natural Historical Collections should be to impart instruction to the young and rising generation, and afford every facility for the advancement of our scientific students, and the question whether they are now conveniently placed is mainly for them to answer. If in the future South Kensington is to become a great centre of scientific instruction, then, and not otherwise, the Natural History Collections have been placed in their most suitable position.

We cannot conclude this hasty notice without stating that the old restrictions as to days of admission have all been swept away, and the collections will from and after the 18th be open daily to the public, save on Sundays, Christmas Day, and Good Friday, and other public fast days, &c.; good and cheap guide-books are also to be ready for the 18th.

For this and other concessions the public are mainly indebted to the untiring energy and determination of the present principal Librarian, Mr. Edward A. Bond, LL.D., who has also been the means of introducing many necessary and useful reforms into the old building; not the least being the electric light, which it may be hoped will ere long cast its beams over the collections in the Natural History Museum, Cromwell Road, South Kensington.

TEXT-BOOK OF MECHANICS

A Text-Book of Elementary Mechanics, for the Use of Colleges and Schools. By Edward S. Dana, Assistant Professor of Natural Philosophy in Yale College. (New York: John Wiley and Sons, 1881.)

THIS is a small-sized book of 290 pages printed in fairly clear type, and bound in an unpleasant-looking cover, and we learn from the preface that it has been prepared to meet the special wants of Yale College instruction. An endeavour has been made to dwell more fully than usual on the principles of the subject, at the same time illustrating these principles in their practical bearings by descriptions of various machines and appliances, while no mathematical knowledge beyond the rudiments of algebra and trigonometry is required. From this it may be presumed that the book is intended for a very elementary class of students, at a lower stage, if possible, than "Poll" men at Cambridge, or else that it aims at assisting self-education by supplying the place of a tutor. An undoubtedly good feature in the book is the collection of examples, some of which are interspersed in the text, and others collected in a body at the end, where the answers are given. The metrical and ordinary units are both employed. These examples are perhaps the only part of the book which would be of any value to teachers in this country. With regard to the main subject-matter of the book, Dynamics is placed first, and Statics follows, with a chapter on the Pendulum at the end. The definitions and the explanation of the principles of the subject, though aiming at fulness and clearness, are not always so satisfactory as might be wished. A tendency to looseness of expression sometimes counterbalances the value of the fuller explanation. To explain *solidity* we are told that "A solid is characterised by a greater or less degree of rigidity," which in the absence of a separate definition of rigidity leaves us much where we were before. Again, the definition of a *liquid* is this, "A liquid is characterised by its mobility; the molecules are free to move about each other, and the liquid takes the shape of any containing vessel," which is equally true of a *gas*. The proof of the formula $S = \frac{1}{2}ft^2$ is clenched by the proposition that "when two sets of variable quantities, which are always equal, simultaneously approach their limits, these limits are equal," which is suddenly introduced without any explanation of its meaning. This, in a book intended for beginners unacquainted with the idea of a "limit," would be likely to cause some bewilderment. There is a chapter devoted to Work and Energy, as should be the case with all text-books of mechanics nowadays.

In the dynamical section there is an entire omission of "Sliding in Chords of a Vertical Circle" and the pretty problems connected with it. In the statics there is no mention of the stability or instability of equilibrium of one curved surface rolling on another. The micrometer screw surprises us by appearing with the mechanical powers alongside of the wheel and axle and differential screw.

As the compiler has not acknowledged his indebtedness to other works, it is difficult to say how much of this book is original. But we seem to catch echoes of Ganot's "Physics" and of Goodeve's two text-books on Mechanics and Mechanism here and there. For instance, Articles 7, 8, 107, 111 remind one of Ganot, Articles 197, 207, 209, 239 of Goodeve. The woodcuts, some of which are good, and others (*e.g.* those in the chapter on Centre of Gravity) very indifferent, are 190 in number. Some of them are apparently reproductions of woodcuts in English books. We instance Figs. 44 and 175, which are strikingly like Figs. 365 [Joule's apparatus] and 19 [block and tackle] in the eighth edition of Ganot's Physics, translated by Atkinson, and Figs. 142*a*, 150, 152, 155 (in Dana), which bear a very close resemblance to Figs. 49, 58, 110, 113 respectively in Goodeve's "Principles of Mechanics," second edition, Fig. 117 in the latter having apparently supplied Dana's three figures, 162, 163, 164 [on Pulleys]. Fig. 145 in Goodeve's "Elements of Mechanism," fifth edition, may well have been the original of Dana's Fig. 156.

It would have been graceful in the compiler of this work to have expressed his acknowledgments to the two excellent little text-books of Goodeve. On the whole, with the reserve above made in favour of the "examples," we think that neither English teachers nor English students will be the losers if they continue to use already existing English text-books of Mechanics, and leave this American competitor to find an audience on the other side of the water.

CONSCIOUS MATTER

Conscious Matter; or, The Physical and the Psychical Universally in Causal Connection. By Stewart Duncan. (London: David Bogue, 1881.)

As the title of this little work sufficiently indicates, the aim of its writer is to furnish a scientific basis for the theory of materialism in the region of mind. It is doubtful whether at this time of day anything very original can be said upon this topic, but Mr. Duncan has succeeded in placing some of the facts in a stronger light than previous writers. The facts to which we allude are those which he calls the "analogies" between forces and feelings. Up to a certain point it is by every one recognised that there is some quantitative relation between neurosis and psychosis; mental processes are universally known to entail wear and tear of cerebral substance. Mr. Stewart Duncan traces this quantitative relation as much into detail as he can, by setting forth in a series of twelve "analogies" the resemblances between forces and feelings. These "analogies" are far from being unopen to criticism severally; but here we shall merely mention what they are, as there is more important criticism to apply to them collectively. The analogies are that feeling and force are each without extension, both related to matter, have "plurality predicable of them as respects their locality," are diverse, have time-extension or duration, also the quality of degree and capability of being compounded or combined, are respectively transmutable *inter se*, &c. Doubtless, as Mr. Duncan observes, such analogies, or, as we should prefer to call them, parallelisms, might be largely multiplied; but what would any number of such parallelisms prove? Not, surely, what Mr. Duncan desires them to prove, viz. that forces stand to feelings in the relation of causes to effects. So far as the tracing of such mere parallelisms is concerned, we might almost as reasonably conclude the recent earthquake at Chio to have been the cause of this review, in that they each possess extension, have diverse parts, and so on. In order to establish a relation of causality we should require to show that the observed parallelism is due to that relation; we cannot argue from the observed parallelism as itself sufficient proof of such relation. Were this not so, there would be no need for Mr. Duncan or any one else to write a book on "The Physical and Psychical Universally in Causal Connection"; for as the fact of a constant parallelism between neural processes and mental processes is now no longer an open question, were mere parallelism sufficient to establish proof of causality, materialism would now be a demonstrated theory.

It is needless here to go into the whole question as to the relation of body and mind, or to point out all the shortcomings of materialism as a philosophical theory. But it is a defect in Mr. Duncan's work that he does not attempt to meet some of the most formidable of the difficulties with which this theory is beset. Thus he does not consider the fact that what we know as matter and force we know only as affections of mind, and therefore that in all speculations upon the nature and potentialities of the former, we already by implication have necessarily assumed priority of the latter. Nor does he seek to explain the apparent want of equivalency between supposed physical antecedents and supposed mental consequents—why it is that the brain of a Newton required less nourishment than that of an elephant. Lastly, the greatest of all the difficulties is not adequately treated—that, namely, which is connected with the doctrine of the conservation of energy. Are we or are we not to suppose that thought has a mechanical equivalent? If materialists say that we are, then thought itself becomes a mode of energy, or rather energy by becoming thought ceases to be energy—is destroyed as energy; and so this answer would militate against the doctrine in question. If, on the other hand, it is said that thought has no mechanical equivalent, and yet that energy causes thought, the statement is still in conflict with the doctrine of conservation, because it supposes that energy in the brain differs from energy everywhere else in producing more than its equivalent measure of result. How then under any view are we to conceive of thought as an *effect* of energy? By no stretch of imagination can we attain to the idea of a motor becoming a motive; and if we could attain to such an idea, it would seem to be at the cost of upsetting the most fundamental doctrine of modern physics. And let it be observed in this connection that Mr. Duncan is not very accurate in the statement of his first "analogy," where he says that "Feeling and Force are alike in being both destitute of space-extension." Force in activity is only known as motion in space, while Feeling in activity cannot be conceived as here or there; the conception of Force without any actual or potential relation to space is as impossible as the conception of Feeling in such a relation.

Mr. Duncan's book, however, is worthy of the attention of psychologists, because although we think his attempt to prove a causal relation between physics and psychics a necessary failure, his work is interesting and suggestive if viewed from the standpoint of Clifford's doctrine of "Mind-stuff." If we suppose that Force and Feeling are everywhere one, and so that "all the universe is made up of Mind-stuff," we have a logically possible theory which does not labour under any of the logical disadvantages attending the theory of causality proceeding from matter in motion to mind, or *vice versâ*. Some passages in Mr. Duncan's work seem to show that he has very nearly entered this conception himself; and we therefore feel that he would have written a more valuable treatise if, going a little further, he had discarded the obsolete attempt to explain parallelisms by an impossible theory of *causality*, and undertaken to argue that these parallelisms are really due to a fundamental *identity*, which, as Lewes puts it, is phenomenally diverse only in relation to our modes of apprehension.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

Study of the Physical Nature of the Sun

HAVING been engaged for some time past in discussing with that able scientist, the Spanish Astronomer-Royal, Signor Antonio Agular, Director-General of both the Astronomical and Meteorological Observatories of Madrid, the best method of realising for the requirements of modern science the peculiar advantages presented by the Peak of Teneriffe for studying and eliminating the interfering effects of the earth's atmosphere on many classes of astronomical, meteorological, and physical observations—it has just resulted, not exactly in the general facilitation which I had hoped for towards the *savants* of all nations—but in a particular letter to myself of gracious recommendation by Spanish royal authority to the Captain-General of the Canarian Archipelago.

As however I am totally unable, for reasons well known to our own Government both now and for many years past, to undertake any such research, however useful or pressing—it may be of service to the cause, and to other workers who are more favourably situated financially, to make known how liberally the Spanish Government is inclined at the present moment towards any genuine efforts, even of individuals, to improve our knowledge of the great central luminary by making superior observations with improved instruments at some considerable level above the ordinary clouds and winds of the summer season; and which superiority of site can only be well obtained on this side of the world by means of that grand Mountain-island which Spain has ruled so long and so well,—viz. the Island of Teneriffe. I have therefore now the pleasure of appending a close translation of the official letter, or rather Royal Order, from Madrid,—a copy of which Don Antonio Aguilar kindly informs me has already been communicated by the Spanish Government to the Chief Governor of the Canarian Islands.

"*From the Ministry 'de Fomento,' Madrid, to the Director-General of Public Instruction.*

"ILLUSTRIOUS SIR,—In consequence of the Report of the Director-General of the Astronomical and Meteorological Observatories of this capital, the King has deigned to order that the Governor of the Province of the Canaries, and all authorities dependent upon him, should give special attention to provide whatever assistance he may require to Mr. Piazzi Smyth, Director of the Observatory, Edinburgh, in the expedition which is proposed to the Island of Teneriffe, with the object of trying, on the height of the Peak of Teyde, the instruments designed, or improved by him for the study of the physical constitution of the Sun.

"By Royal Order I transmit this to you for your information, and may God preserve you many years.

"(Signed) — — —

"On the 22nd March, 1881"

A friend well acquainted with both England and Spain informs me that we have not in this country any exact analogue to the Ministry "de Fomento." The literary or theoretical meaning of the word is "supporting, encouraging, cherishing"; and the practical result in this case has been, that a poor individual here, unrecommended by the Government, or the greater Learned Societies, or Universities of his own land, but having an *excelsior* natural object to labour at, has received this very honourable testimony and encouraging recommendation. All honour then to the Government of Spain therefor; and may they meet at last with a more worthy subject for their gracious "Fomento," than

Your obedient servant,

Edinburgh, April 9 PIAZZI SMYTH

Winter Gnats (Trichocera)

THE winter gnat (*Trichocera hiemalis*, D. G.) is one of the subjects of phenological observations undertaken by the Meteorological Society. Its appearance directly after long-continued frost, often whilst the thaw is in progress, has frequently led entomologists to inquire whether the insects then seen have been hybernating during the cold weather, or have newly emerged from the pupa. No evidence has been adduced in support of either alternative. Some facts concerning the habits of the fly, noted as opportunity occurred during the last two winters, bear upon the matter in question, and may therefore be of interest to both the above classes of your readers. The name *Trichocera hiemalis* is used here in its meteorological sense, for nobody would pretend to distinguish this abundant species at a distance from the common *T. regelationis*.

With a view to learning what becomes of the winter gnats during inclement weather I frequently jotted down, when the flies were upon the wing, the temperature of the air in the places of their resort, the time of the day, and any peculiarity noticeable in the flight of the insects. Upon other occasions, at corresponding periods of the day, when the weather was colder and no gnats could be seen anywhere, I made similar entries of the temperature prevailing in their usual playgrounds. The instrument employed was a Casella's pocket-thermometer mounted in ebonite, graduated upon the stem at intervals of every two degrees, and duly compared with a standard.

From the notes thus obtained, which need not be quoted in detail, it appears that the flight of *Trichocera* varies in style with the temperature, and, as a general rule, is altogether discontinued when the cold exceeds 36° F. Once indeed I saw a gnat flying when the thermometer stood at 34°·5 F., but there was reason for suspecting that it had just been startled out of the hedge by a passing carriage. When such low readings as these are obtained the insects do not congregate, but fly singly with a heavy drowsy flight, as though impelled by business rather than pleasure; and very few venture to show themselves upon the wing at all. At temperatures of 38° to 42° F. they may be seen occasionally flying steadily in places sheltered from wind; and when a warmth of 45° F., or more, is attained, they throng together and dance for joy. These particulars, by the way, need not prompt meteorologists to do something with their phenological tables by entering in them "*Trichocera* flying" every calm winter's afternoon if the temperature exceeds 40° F., without troubling themselves to go out of doors and look after the gnats.

It was some time before I succeeded in tracing *Trichocera* to the places where it seeks repose after its gambols and whiles away periods of weather too cold or boisterous for excursions abroad. The flies may be seen sometimes at rest upon fences, with their legs stretched out flat, and it appeared probable that they took refuge in the hedges somewhere. A very favourite harbourage of theirs however seems to be the under side of boards and stones frequented by woodlice and earthworms. They stand back downwards on the wood or stone, not upon the earth below; and although the specimens found in such situations are mostly females who have gone there to lay eggs, I have once or twice noticed males taking shelter in similar places. Beneath a single flower-pot saucer standing upon damp earth, and eight inches across the bottom, I have counted as many as ten females at once; an individual gnat dislodged crept back underneath it again; but the site became dry, and they forsook it. The wonder was how they managed to enter so shallow a crevice in the first instance. The haunts of the isopod, *Trichoniscus pusillus*, are not too damp for them; but in frosty weather they are apt to take shelter under any dry pieces of wood lying loosely upon the ground. It is obvious that flies with such habits as these cannot fail to be snowed up in great numbers at the first fall; and when the frost is over, having been securely protected from extreme cold, they are ready to take wing again as soon as the snow has melted sufficiently to admit of their creeping forth. Hence, though the temperature may be relatively mild directly after a snowstorm, no gnats are likely to be seen flying until the snow has largely disappeared, when *Trichocera* will become common. Similarly after frost without snow, when the thaw sets in the flies will probably not issue from their retirement immediately, but will rest quietly until the change of temperature has had time to reach them in their lurking-places, whatever may be the warmth of the outer air meanwhile. Perhaps this is the cause of so few winter gnats being seen in the mornings early in the year; but whether it be so or not, the other foregoing surmises harmonise well with my observations.

The maximum of cold to which winter gnats can be exposed without fatal consequences has not yet been ascertained.

Australian Plants in India

IN NATURE, vol. xxiii. p. 370, some remarks are made (with reference to Mr. Wallace's observations in "Island Life") regarding the apparent inability of Australian plants to become naturalised in the northern hemisphere. It may therefore be interesting to you and to Mr. Wallace to learn of some striking exceptions to this rule in the case of Australian plants which have been introduced on the Nilgiri plateau in Southern India, at elevations ranging from about 5500 to nearly 8000 feet above sea-level. Acacias and Eucalypti in particular have found a congenial home in this region, and visitors from Australia who have seen them say that they appear even more vigorous than in their native soil. Hundreds of acres of *Eucalyptus Globulus* and of *Acacia melanoxylon* and *A. dealbata* have been planted by Government as firewood reserves, and the trees have grown up splendidly. The only drawback to the success of the experiment has been that the *Acacia melanoxylon* has been greatly injured by Loranthaceous parasites. In fact this species will apparently in course of time be exterminated by these indigenous pests. Besides *Eucalyptus Globulus* the following species of the genus have also been introduced, and thrive well:—*E. sideroxylon*, *E. obliqua*, *E. fissilis*, *E. rostrata*, *E. viminalis*, *E. amygdalina*, and *E. perfoliata*. In addition to the two species of *Acacia* already mentioned, the following have also been added to the list of healthy growing exotics on the Nilgiris, viz. *A. pycnantha*, *A. salicina*, *A. longifolia*, *A. decurrens*, *A. cultriformis*, *A. elata*, and others, might also be enumerated. As regards other Australian plants on these hills we have *Hakea*, *Banksia*, *Myoporum*, *Kunzea*, *Tristania*, *Pittosporum*, *Beaufortia*, &c. In short there is a very considerable Australian flora flourishing on the "Blue Mountains" of Madras, and so extensively have the trees been planted out about the principal stations that they have given quite a new character to the scenery. Some of the acacias have a considerable resemblance in shape and colour to the Scotch fir, and this likeness has, to some visitors, added a fresh charm to the beauties of the scenery. G. BIDIE

Madras, March 15

The Tide Predicter

WITH regard to the letter of Sir William Thomson in NATURE, vol. xxiii. p. 482, respecting the above instrument, I may say that the Tide Predicter which I have planned and designed for the prediction of Indian tides owes its development, not to the British Association Tide Predicter, but to a complete two-component working model made by me in the spring of 1873. This model was made before the British Association instrument was designed.

It was on the express recommendation of the Surveyor-General and Superintendent of the Great Trigonometrical Survey of India that I was invited to plan and undertake the construction of the instrument, and I was left absolutely unfettered in my choice of mechanicians to carry out the work. My connection with the instrument is clearly explained in the official prefaces to the Tide Tables for Indian Ports, 1881, published by authority of the Secretary of State for India in Council. I may point out that my paper upon this instrument (*Proceedings* Roy. Soc., No. 197, 1879) was written at the desire of Sir William Thomson, to whom it was first submitted, and by whom it was entirely approved and originally communicated. He was also present at the meeting of the Royal Society when the paper was read, and never expressed the least objection to any of its contents. In that paper credit is given to him for the improved slide, which he, with Prof. James Thomson's assistance, had devised for an harmonic analyser, and also to Mr. A. Legé for the admirable plan of the wheel-gearing. EDWARD ROBERTS

"The Oldest Picture in the World"

IN Mr. Loftie's "Ride in Egypt" is a woodcut (p. 209) of what is called "the oldest picture in the world," a fresco from a tomb at Maydoom, now in the museum at Boolak, wherein are represented six "pasturing geese." Two of these are undoubtedly *Anser albifrons*, two, probably *A. ferus* or *A. segetum*, and the other two seem to be the rare *A. ruficollis*, from Northern Asia. I should be greatly obliged to any one who would let me see a *coloured* copy of this picture, that I might be assured as to my determination of the figures. Mr. Dresser, in his excellent "Birds of Europe," mentions his having received a specimen of *A. ruficollis* sent him from Alexandria by the late Mr. Stafford Allen. Otherwise its appearance in Egypt seems to have been hitherto unrecorded. ALFRED NEWTON

Magdalene College, Cambridge, April 10

Probably New Variable Star

ON January 22, 1879, I observed near O^2 Canis, a very remarkable double star, with one component a fiery red 8·5 magnitude, and the other a blue 9. The contrast of colours was very striking, but there was little difference in size. In a letter recently received from the Rev. Mr. Webb, I find that it was previously observed by him, and it appears as one of his own discoveries in the second edition of "Celestial Objects," published in 1868. The red star is there classed as 6·5 mag., and the blue as 8. The two stars, therefore, appeared to differ very considerably in magnitude when seen by Mr. Webb, while to me, eleven years subsequently, they seemed quite nearly equal. Hence I conclude that the red is a variable, and I wish to call the attention of observers to it while it still remains in view. By a rough measurement I make out its position for 1881 = α 7h. 10m. 44s., and δ = 23° 6′·6. JOHN BIRMINGHAM.

Millbrook, Tuam, April 9

Concealed Bridging Convolutions in a Human Brain

IN his work on the "Convolutions of the Human Brain" Ecker denies explicitly that the first and second external bridging convolutions of Gratiolet, as seen in Cercopithecus, Inuus, &c., are ever concealed, either in the higher apes or in fœtal or adult man. I have however in my possession an adult human brain in which a convolution nearly corresponding in position to the external bridging one of Gratiolet is concealed, while another slightly external to it is nearly so. The brain was hardened in nitric acid with the membranes on (a much preferable method, by the by, to that of first removing the membranes; as these, by absorbing the acid and swelling, serve, like so many wedges, to keep the convolutions apart, and prevent the shrinkage that otherwise takes place). There was no indication of any concealed convolution until the membranes, just moistened for the purpose with water, were being removed. Then, owing to the opening out of the sulcus occipitalis transversus of Ecker, the tip of one became visible, and this tip, even now that the edges of the sulcus are widely separated, is from one-eighth to one-sixth of an inch beneath the general surface.

Its position relative to the great longitudinal fissure and to the posterior border of the gyrus supramarginalis seems to me pretty accurately to correspond to that of the external bridging convolution to those parts in the brain of an Indian pig-tailed baboon of undetermined species with which I have compared it; but in the latter the sulcus occipitalis transversus does not exist, while in this human brain, as is very common, the lateral or horizontal portion of the fissura parieto occipitalis, beneath the bevelled edge of which in the baboon the convolution lies concealed, has a very short course indeed.

The only difference then is that in the one specimen (the human) the concealed convolution lies in the transverse occipital fissure, there being no lateral extension of the parieto-occipital fissure, while in the other it lies in the parieto-occipital fissure, the transverse fissure not existing WILLIAM CARTER

Liverpool, March 26

Sound of the Aurora

IF I had consulted Franklin's account of his Polar researches before I sent you my extract from Tacitus, I should not have revived the question of sounds being heard with the aurora borealis. Franklin and his companions watched the aurora 343 times in two successive winter seasons; and never once, he says, did they observe a sound. Were, then, the experiences quoted by your other correspondent and myself mere illusions? Perhaps not. Franklin made his observations at and about the southern shore of Bear Lake, in latitudes varying from 67° to 69° north; might not the greater volume of air through which the phenomenon had to pass in reaching our island have caused the electric fluid to work up a sound? Surely that is possible The attractive force of the aurora is—we learn from Franklin himself—increased within a certain limit as its rays proceed southwards; for whereas Parry and his party at Port Bowen in latitude 73° 15′ noticed no deflection of the compass-needle under the influence of coruscations, Franklin and his party on the shores of the Bear Lake, six degrees further south, constantly observed this effect. And the attractive force is strongly felt here—hindering telegraphic communication at all events. Might not the vibratory force not sensible at within so short a distance from its origin as the attraction be increased within a greater limit? M. L. ROUSE

Sunnymead, Chislehurst Common

PERIODIC OSCILLATIONS OF BAROMETRIC PRESSURE

THE MSS. of the accompanying article, which was left unfinished by the late Mr. John Allan Broun, F.R.S., were handed over to me some time ago by Prof. Balfour Stewart, with a request that I would put them into shape for publication.

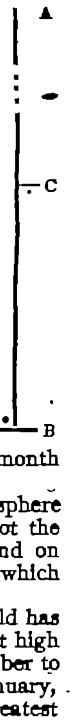
I have not found it necessary to make many alterations in, or additions to the original, and where made they are mostly indicated in initialed foot-notes.

E. DOUGLAS ARCHIBALD

In an article which appeared in NATURE (vol. xix. p. 6) a remarkable relation was shown to exist between the annual ranges of the atmospheric pressure and of the temperature of the air, as derived from the monthly means obtained from several years' observations of the barometer and thermometer at certain stations in India. The results and the conclusions from them do not appear to have been always understood, and as they bear on some of the most interesting questions on meteorology, I shall now examine them anew with the aid of observations at some other stations, under different local conditions.

For this end it is desirable to employ some elementary considerations. Let us, first of all, consider the action of varying temperature on a vertical column of the atmosphere. Let us consider a column of air reaching from the soil at B to the upper limit of the atmosphere at A; and suppose that the pressure shown by a barometer at B is 30 inches, while at a higher station, C, it is only 20 inches. If, now, the column of air is heated so that the temperature of the part B C is increased by 10° F. we know from laboratory experiments that the air will expand, so that a part of that which was below C will be pushed above it, and while the barometer at B will continue to show 30 inches, that at C will show 20·2 inches, the mercury at C will have risen two-tenths of an inch.

If, now, we suppose that the mass of air remains constant throughout the year, there will be an annual variation of the barometer at C, where its height will be greatest in the warmest month and lowest in the coldest month. For the same reason the difference of the barometric heights at B and C will be least in the warmest month and greatest in the coldest.



It has been supposed that the mass of the atmosphere remains constant throughout the year; if this is not the case the variations of pressure at C will not depend on temperature alone, but also on the other causes which produce variations at B.

In NATURE, vol. xx. p. 55, Mr. Douglas Archibald has given a series of differences of barometric heights at high and low stations in India for the months from October to April. The month of lowest mean temperature, January, shows always, as in the case just supposed, the greatest difference of pressures. As the high and low station is never in the same vertical, the one being sometimes 300 miles horizontally distant from the other, it is difficult to eliminate the part of the variation due to temperature at the higher station, but if we take as an approximation, however rude, the mean of the temperatures at the two stations as that of the vertical column, we can see that a considerable part of the variation at the upper station may be due to the expansion of the column with temperature.

Thus for Leh and Lahore the mean temperatures and difference of barometric heights are[1]:—

---

[1] The numbers are taken from the work cited by Mr. Archibald, "The Indian Meteorologist's *Vade Mecum*," by Mr. H. F. Blanford, Pt. ii. pp. 176, 178.

	Mean temp. °	Diff. of Pressures. in.
January	35·0 Fahr.	9·690
July	74·1 ,,	9·105

Now as the difference of the mean temperature of these two months is nearly 40°, according to what has been said before, the expansion of the air from January to July should have increased the pressure at the upper station by about 0·8 inch (eight-tenths of an inch of mercury) and have diminished the difference of pressures by that amount. The observed diminution is, however, less than 0·6 inch, a deficiency of two-tenths, which has to be accounted for in some other way.

In the case of the annual variation of atmospheric pressure near the sea-level, we have to consider only the atmosphere above the station; but in that for a high station we have a much more complicated problem in which the atmosphere below the station plays an important part, a part also which may vary greatly, according as the upper station is on a mountain top, on a gradually ascending height, or on high table land.

It was for these reasons that in the article (NATURE, vol. xix. p. 6) under consideration, nothing was said of the annual variation on mountains or at great heights; the results were obtained from observations at stations little above the sea level, and from them it appeared that for every degree Fahrenheit on the range of monthly mean temperature, there was a variation of from ·021 inch at Singapore, to ·025 inch at Bombay and Madras, in the range of the monthly mean barometric height; while at Pekin the amount was diminished to ·015 inch. The conclusion that this ratio was nearly constant in India referred necessarily to stations under similar conditions. Mr. Archibald's letter has brought to notice a series of Indian observations made at stations farther from the sea and in North India, which are given in an interesting and useful work by Mr. H. F. Blanford, Meteorological Reporter to the Government of India, and which merit consideration. The means employed by me previously were derived from observations at standard observatories during five to twenty-six years; and it was mentioned that, as single years gave somewhat variable results, the monthly means from several years' observations were necessary for accurate values. In the cases to be found in Mr. Blanford's work, several are of observations during only two years (or even less), and we have no exact idea of the weight which in any case can be accorded to the observations at the stations. As, however, the results for different stations in general confirm each other (the exceptional cases will be noticed apart), I shall here form a series of groups of stations, each group under nearly the same local conditions as regards latitude, height above, and distance from, the sea. The value of k, the variation in thousandths of an inch, of pressure-range for 1° F. of the temperature-range, is the same for all stations in each group, with the exceptions referred to below.

Thus the most northerly group near latitude 30° N. and 600 miles from the sea, viz., Lahore, Delhi, Dera Ismail Khan, Mooltan, and Roorkee, gives the following result:—

Mean latitude of group (λ).	Mean height above the sea (h).	Mean annual temperature (t).	Mean ranges of temperature and pressure		Mean barometric oscillation for 1° Fahr. $\left(k = \frac{\Delta p}{\Delta t}\right)$.
			Δt	Δp	
°	feet.	°	°	inch.	
30¼	660	75·2	39·0	0·620	0·016

This group extends about 450 miles from Delhi to Dera Ismail Khan, and the heights vary from 440 to 890 feet. The value of k is the some for each station.

The next group comprises Bareilly, Lucknow, Jhansi, and Benares, for which the following are the values of the different elements:—

λ	h	t	Δt	Δp	k
°	feet.	°	°	in.	
26	520	77·7	32·4	0·554	0·017

The distance of the extreme stations is not 300 miles; the heights vary from 270 feet at Benares to 860 feet at Jhansi. For each station k = 0·017.[1]

The third group includes Patua and Gya and the values are—

λ	h	t	Δt	Δp	k
°	feet.			in.	
25¼	260	78·5	28·0	0·537	0·019

The distance between the two stations is about 70 miles; the heights are 179 and 347 feet respectively, and the values of k are within half a thousandth of each other.

The fourth group includes Berhampore, Burdwan, Dacca, Goalpara, Chittagong, Calcutta, and Saugor Island, for which the values are—

λ	h	t	Δt	Δp	k
°	feet.	°		in.	
23¼	100	78·0	18·7	0·471	0·025

With the exception of Goalpara and Chittagong, these stations all lie in the Gangetic delta, at nearly the same elevation, and with an extreme variation in the value of k amounting to 0·004 inch.[2]

The fifth group includes Bombay alone, the values for which are—

λ	h	t	Δt	Δp	k
°	feet.	°	°	in.	
18¼	37	78·8	11·6	0·287	0·024

The sixth, Madras, Negapatam, Trichinopoly, and Madura, with the values—

λ	h	t	Δt	Δp	k
°	feet.	°	°	in	
11¼	190	81·7	11·1	0·243	0·021

The seventh, Colombo, with the values—

λ	h	t	Δt	Δp	k
°	feet.	°	°	in.	
6¼	42	81·3	3·6	0·069	0·019

It will be seen from this table that the value of k is a maximum (= 0·025) nearly under the tropic of Cancer, that it diminishes thence both north and south. This diminution cannot, however, be attributed altogether at least to the latitude, since the value is nearly the same at Pekin and at Delhi.

The variation of the value in Northern India from the maximum near Calcutta has an apparent relation to the height above the sea and the distance from it,[3] as well as to the amount of the temperature oscillation; the value of k diminishing as the others increase. We cannot, however, relate the value to any one of the other variables. No doubt height above the sea may have some influence, as has already been shown, but here mountain stations have been avoided; and while in the Lahore group the heights vary from 420 feet (Mooltan) to 890 feet (Roorkee), the value of k remains constant.

It should be observed that the temperature ranges are those of the stratum of air a few feet above the soil, while the ranges of pressure include the whole atmosphere above each station. We see that the value of k diminishes as the range of the surface-temperature increases, and it is certain that the ranges of the temperature at all the stations as we ascend above *the soil*, will approach always nearer to each other the higher we go; so that if we knew in what way the relation between the oscillations is produced, and thence, in all probability, the part of the atmosphere which is chiefly in question, we might find a more constant relation between Δt and Δp at all the stations.

---

[1] There appears to be some difference in the values of Δp as got by Mr. Broun and those derived from my edition of the "Vade Mecum" for these two groups. Thus from my edition (1877), the value of Δp for Group I. is 0·614, and therefore k = 0·015; there are also slight differences in the value of k at each station. In Group II. k is 0·017 only for Bareilly and Lucknow, the value for Jhansi and Benares being 0·016.—E. D. A.

[2] The figures for the fourth group have been supplied, and the fifth, sixth, and seventh groups have been added as the text seemed to imply their intended formation by the author.—E. D. A.

[3] Mr. Archibald has considered height not to be an element, and he cites in evidence Lucknow and Sibsagar, very nearly at the same height; the former having k = 0·017 and the latter k = 0·028 (NATURE, vol. xx., footnote p. 54). The latter value, however, is a mistake, for at Sibsagar k = 0·018, very nearly as at Lucknow. Mr. Archibald's conclusion is that it is not height, but distance from the sea, as the stations are at widely different distances from the sea. We should, owing to this error, be obliged to reverse the conclusion, and say it is not distance from the sea, but height, that is in question; but, in reality, Sibsagar though not so far from the sea, is still as far as Patna or Gya, with nearly the same value of k.

[See my note on this point, NATURE, vol. xxi. p. 131.—E. D. A.]

I will now proceed to make some remarks which may aid in the study of these questions. I would first observe with relation to the stations in the preceding table that the value of k is only 0·024 at Chittagong, while it is nearly 0·029 at Saugor Island. I have no doubt, however, that this difference is due to some local or instrumental cause.

In the first article I have, as already stated, used only observations made in first-class observatories. Every one acquainted with the difficulties of obtaining good observations in India, especially at out-stations, will understand that the mere printing of their results cannot give them any certain weight. Thus from the tables of means given in Mr. Blanford's work, it appears that the value of k at Vizagapatam is 0·032, while at Cuttack less than 3° to the north, it is 0·025. This great difference would lead to the conclusion that there must be some remarkable local cause, or that there is some error in the observations; if the former, then farther research as to this cause would be of the highest importance; the latter seems to me the most probable explanation. The following example, that of a station so well known as Madras, will show some reason for this belief. The results for Madras, given in the table, are those employed in the first article, and deduced from observations made in the Magnetic and Meteorological Observatory from 1841 till 1855. In Mr. Blanford's tables, however, means are given from observations for nine years. These means give results markedly different from the others. The following summary for the months of December, January, and June, will prove this:—

Group of Years.	Height of Barometer. December.	January.	June.
1841–45	29·954	29·998	29·691
1846–50	·957	·986	·693
1851–55	·992	·998	·702
Means	·967	·994	·695
1868–71	·978	·967	·671
1872–76	·955	·926	·802
Mr. Blanford's means for nine years	·965	·944	·744

Now the three means for January, each deduced from five years' observations, do not deviate from the mean of the whole more than ·008 inch, while the corresponding extreme deviation for June is ·0 7 inch. Whereas the means from nine years, according to Mr. Blanford's tables, differ by 0·050 inch from the means of fifteen years, and the annual range, which is 0·299 by the fifteen years' observations, becomes only 0·200 by the last series. Judging from the means for four years—given by Mr. Blanford in his valuable memoir in the *Phil. Trans.* on the winds of North India—which I believe to be part of the nine years, the means for five years, 1872–76, give a range of only 0·124 inch from January to June; but even the mean pressure for the place and the annual law of variation is altered by the nine-year series, the maximum pressure occurring in December instead of January. It is essential in such investigations that some confidence can be placed in the observations, and if this can be done anywhere it is certainly in observations made at such a station as Madras. I have employed previously means deduced from fifteen years' observations in the Magnetic and Meteorological Observatory; but these means differ in a manner so extraordinary (for a South Indian station) from the means given by Mr. Blanford from nine years' observations, that this demands attention and explanation.[1]

We see that the annual oscillation of pressure increases with that of temperature, and as shown in the article already cited, that this relation holds for two places on opposite sides of the Ghâts, nearly at the same height within sixty miles of each other, for which the annual oscillations at one are twice those for the other.

Let us now see what our knowledge from laboratory experiments of the laws of expansion and equilibrium of gases would induce us to conclude with reference to the stations in question.

In the first place, let us remember that the yearly mean temperature at Pallamcottah is about 7° Fahr. greater than at Trevandrum, while the yearly mean pressure is the same. We conclude at once from this result that the mean pressure does not depend on the mean temperature.

I stated that the mean temperature in January at Pallamcottah, on the east side of the Ghâts, was 4° Fahr. greater than at Trevandrum, sixty miles distant on the west side of the mountains, and that the mean pressure was 0·065 greater at the former than at the latter. Sir John Herschel has shown that according to our knowledge of the expansion of gases, there should be a single diurnal atmospheric tide due to one side of the earth being warmer than the other, and this due to the expansion of the gases in the warmer half causing the centre of gravity of the air to be higher than in the other, should produce a sliding motion of the warmer air towards the colder in twelve hours.

If such a result is what may be supposed to occur in the period of a day, there cannot be the smallest doubt that if a mass of the atmosphere has a lower pressure and a lower temperature than another mass at a short distance, the former should flow towards the latter, and produce equilibrium within twenty-four hours. Here, however, we find that there is a difference of pressure of 0·065 inch, which remains during a whole month at a distance of sixty miles, and this continued difference of pressures is not to be explained by any known property of gases.

We see, indeed, the remarkable fact that the oscillation of the monthly mean pressure at one station proceeds quite independently of that at the other, and both in a constant ratio with the variation of the temperature of the atmosphere in the lowest stratum.[2] All this is inexplicable by any heating action alone.

I have omitted all notice of the aqueous vapour in the atmosphere. It is obvious, however, that this cannot explain the annual oscillation of pressure, since it is just when the tension of vapour is greatest, that the barometric height is least. The introduction of more vapour into the atmosphere does not make the whole lighter, but heavier; and when we adopt the arithmetical operation of Dove and subduct the vapour pressure from the barometric height, we find the oscillation to be greater, not less, than before.

It is not easy to determine the variation of vapour pressure from the indications of the dry- and wet-bulb thermometers, and the exact result of the total vapour above the barometer cannot as yet be determined, but its amount will not explain the annual law, nor will it explain the independent oscillations in question. I have, however, long ago suggested that the humidity of the air may be in question, and as the oscillations of dryness or humidity of the lower mass are probably related to the temperature, the oscillations of pressure may also be related to them.

Sedgwick has said, in his inaugural discourse on the studies of his University: "To explain difficulties in these questions, the atmospheric strata have been shuffled in accordance with laboratory experiments." Thus, for example, the mean pressure of the atmosphere remains, on the average of the whole year, 0·038 inch lower for every 100 miles we proceed north in this country, a difference which is called a *gradient*, as if it were a fall on a railway line, though it is really the position of equilibrium like that of the watery ocean, which has also a gradient of nearly thirty miles from the equator to the poles.

---

[1] Mr. Broun asked me if I know what years made up the nine, but I know of no one except Mr. Blanford himself who can give a satisfactory answer to this question, and he is in India. The "Vade Mecum" being an official work, ought certainly to be trustworthy.—E. D. A.

[2] And probably of the mean temperature of a layer of some considerable height.

I have previously remarked that at Bombay the maximum pressure precedes nearly by a month the minimum temperature, while the minimum pressure is a month later than the maximum temperature. This is also true for all the stations in North India. At Madras, however, and Trevandrum, January becomes the month of maximum pressure. I do not, therefore, place much weight on this fact as showing that the two oscillations are not cause and effect. The month of maximum pressure at Pekin agrees most nearly with that of minimum temperature.

I have stated in the first article on this subject that I did not admit that the oscillation of pressure was due to that of temperature, and therefore could not allow that a higher annual mean temperature [would in any case cause a lower annual mean pressure]. From the fact that the annual variation of pressure and temperature in Central Asia is greater than in any other portion of the globe, the greatest pressure coinciding nearly with the lowest temperature, and the least pressure with the highest temperature, it was concluded by Mr. Chambers that years of greatest mean pressure should also be years of least mean temperature. Now if we assume that the pressure depends only on the mass of the air and watery vapour in it, as the former is constant, and the latter, the only variable part, is greatest when the temperature is highest, it would follow that years of greatest heat should be years of greatest pressure, which is just the reverse of the conclusion deduced by the analogy from the annual variations.

Indeed, it is one of the great difficulties in the hypotheses which have been proposed, to explain the annual variation of pressure of the mixed atmosphere, that when we subduct the vapour pressure, as far as our means of calculating this exist, we have a much larger dry air oscillation than before.

I gave, however, different reasons for concluding that the range of temperature was not itself the cause of the diminished pressure, although the two go nearly together. One was that the observations of Bombay showed the greatest pressure to precede the lowest temperature by a month, and this is true for all the stations in the groups of North India already given. I also pointed out that were the two directly related, the mean pressure at Trevandrum should be greater than at Pallamcottah by nearly one-tenth of an inch, which is not the case, the isobars and isotherms having no relation to each other.

If we suppose that we have the same atmosphere over each station as over the whole earth, there is no possibility of explaining the variation of pressure by that of temperature. The only known property of heat which affects the mass has no doubt been employed to cause the hotter air to flow away somewhere, and surely in that case it should flow to the nearest colder station, where the pressure is less; but we have seen that this is not so in the case of Trevandrum and Pallamcottah, nor is it so in the valleys of the Ganges and Indus, where the oscillation increases as we ascend from the sea. These oscillations proceed with the greatest regularity, approximately in proportion to the temperature variation from month to month, and without the slightest regard to the hypothesis which should cause equilibrium in twenty-four hours, by the sliding of the most expanded masses over those least so. In what way, then, can we associate the two oscillations if one is not the cause of the other? I have long ago suggested that the varying humidity of the air may be in question; this is only a suggestion. I do not mean the mere tension of vapour—as already stated when we try to get rid of that from the total atmospheric pressure, the subject becomes more difficult, the dry air oscillation being greater not less than that of the whole—but if we suppose that the attraction of gravity is not the only attraction which affects the pressure of the atmosphere, but that this pressure varies through some other attracting force such as an electric attraction of the sun depending upon the varying humidity of the air, and this again depending on its temperature; we should find a method of relating the two variations which does not exist if gravitation alone is employed.

It is quite certain that many physicists will not admit the idea of an electric attraction on our atmosphere in the present state of our knowledge, hence the efforts to make expansion, and a shuffling of the atmospheric strata suffice. We must not, however, in our ignorance, attempt to force conclusions in opposition to facts, and if these can be satisfied more easily and with greater probabilities in its favour by the aid of the hypothesis of an electric attraction of the sun, that hypothesis will have a better claim to acceptation than the other.

I shall here note a few facts which cannot be explained by thermic actions.

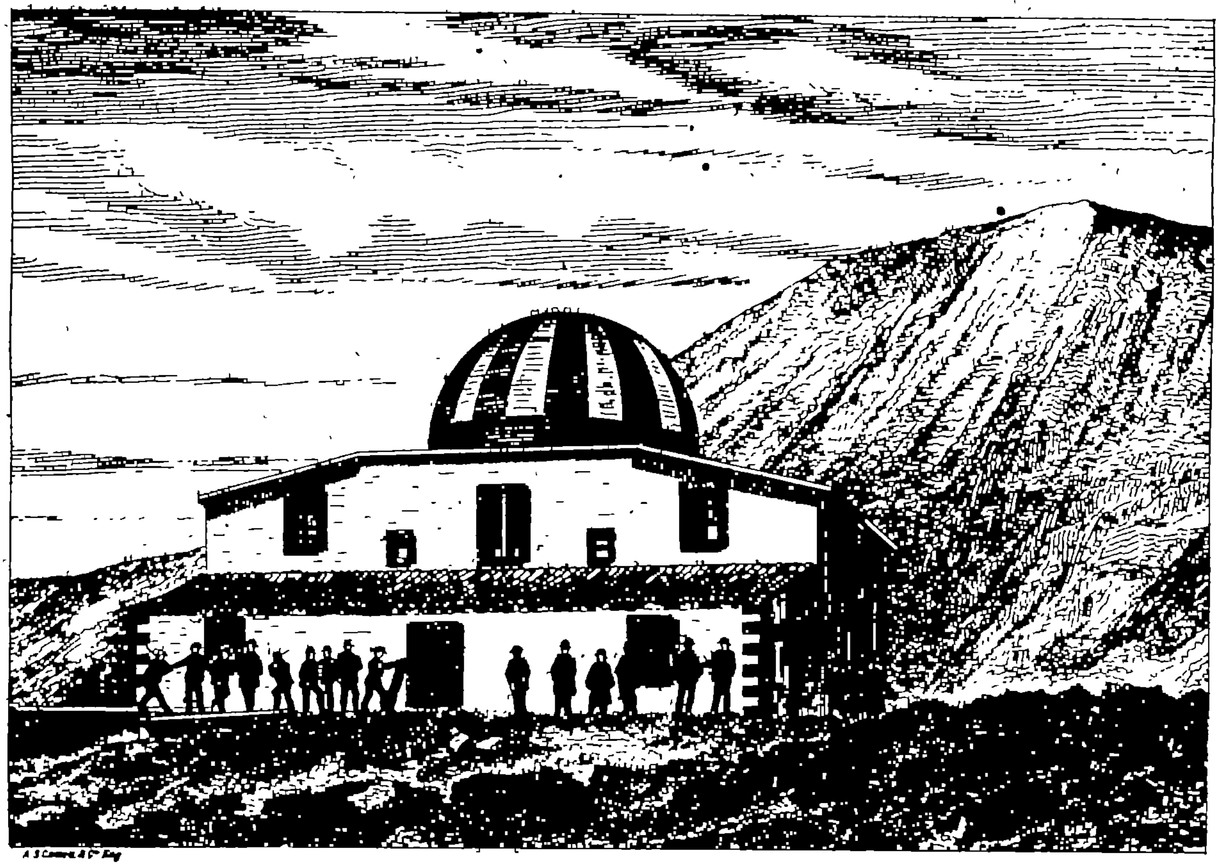
1. I have shown that on the average of many years' observation in our latitudes the mean pressure diminishes at the rate of 0·038 inch of mercury for every one hundred geographical miles we proceed towards the north. This has been called a gradient from the similar term used in railway slopes; but it is no slope, it is a level of a surface of equilibrium like that of the sea. It is the mean heights of the barometer at the sea-level which indicate the form, if we may say so, of the equilibrating atmosphere.

2. In India we have seen that the atmospheric pressure oscillates at each station even when these are quite near to each other, independently of the known laws of equilibrium of pressure of gases.

When we turn to the semi-diurnal oscillation of the barometer we are only amused at the attempts made to explain it by shuffling the atmospheric strata. Nothing can be more certain than that the theories of expansion, or resistance to expansion and overflow, are the vain efforts to make the laws of nature agree with a theory. Over the great ocean within the tropics, where the diurnal variations of temperature are small and the air is absolutely without perceptible currents for days together, the barometer rises and falls a tenth of an inch twice in twenty-four hours with the regularity of the solar clock. The action of the sun on the whole atmosphere which produces this movement varies chiefly during the day hours at inland stations with the temperature oscillation, so that, as in the case of the annual variation, the fall of the barometer at 4 P.M. is greater in the same latitude as the temperature is higher. This variation occurs during the most complete calms; the smoke rises vertically from the plains of Tinnevelly; no current is visible in the motion of the clouds; yet the barometer falls at four in the afternoon as it did at four in the morning, only it falls farther.

THE ETNA OBSERVATORY

THE accompanying illustration of the Observatory on Mount Etna is reproduced from the *Memoirs* of the Italian Spectroscopic Society. It shows that the building is so far complete, and surmounted by its revolving dome for the protection of the large Merz equatorial of thirty-five centimetres aperture. In the engraving the volcanic cone appears much nearer the Observatory than it really is. The work of building was suspended during the stormy weather of 1879, but was completed in the summer of last year. But it cannot be said that the building is yet quite finished and ready for occupation; a good deal of work has yet to be done to the internal walls, the doors and windows, flooring, &c., besides the scientific equipment of the building. Therefore the announcement by the Alpine Club of Catania that the building would be ready for inauguration at the meeting of the Alpine Congress in Catania next September was premature. The Observatory will not really be ready to be opened till 1882. The difficulties that have had to be contended with can only be comprehended by those who have visited the place; all the materials have to be conveyed 3000 metres above the level of the sea, and that during only three months in the year. So that even if not ready till 1882, the work may be said to have been rapidly accomplished. The mounting of the equatorial is finished and the construction of the meteorological apparatus is being proceeded with. The Ministers of Agriculture and Public Instruction are doing their best to provide the Observatory, by 1882, with a director and a staff both of astronomers and meteorologists.



MODE OF MASKING OR CUTTING OFF SHARPLY THE LIGHT FROM REVOLVING APPARATUS ON ANY DESIRED COMPASS-BEARING BY MEANS OF A RECIPROCATING SCREEN

OWING to the optical properties of the lens employed in revolving lights, a formidable element of difficulty comes in the way of effecting a sharp cut-off on a particular bearing; for the direction of the axis of the beam of light which is projected by the lens is being continually changed in the horizontal plane by the revolution of the frame on which it is fixed. So long as the axis of this beam of rays points outside of the line of obscuration the light will not of course encroach on the danger arc, unless to a small extent, when the axis is nearly on the line of cut-off due to the ex-focal rays proceeding from the outer edges of the flame. The light however will begin to be diminished in power from a bearing varying from 12° to 21° outside of the line of cut-off dependent on the size of the lens, the light on the line of cut-off being diminished to the power of one-half. But when the axis crosses that line, then as the rays which come from that part of the apparatus which is still outside of the darkened panes of the lantern is not intercepted by them, the light will begin to be seen within the arc of danger, and as the apparatus goes on revolving the axis will at last point from about 12° to 21° within the danger-arc, according to the breadth of the lens which is employed. Owing to this peculiarity of a revolving light the difficulty of confining the flashes within any required arc of the horizon by means of *fixed* screens is in fact an insurmountable one.

The mode which I have to suggest is as follows:—In front of the revolving apparatus and on the safety side of the danger arc, let a light canvas or metallic screen be constructed for running on rollers on a slightly inclined rail or circular path close to the apparatus. If now a small projecting rod or snug be fixed to the side of each lens it will in revolving be brought against the edge of the screen, and will gradually press the screen before it up the inclined plane at the same rate of motion backwards as that of the lens forwards. By the time the lens reaches the edge of the danger-arc the screen will have been pushed to the top of the inclined plane, and the full beam of light coming from the now entirely uncovered lens will be pointing in the required line of cut-off which is the border of the danger-arc. But whenever the further revolution of the apparatus causes the snug to pass clear of the edge of the screen so as to free it from pressure, it will immediately run back again to its original position in front of the lens, so as to prevent any light being now sent forwards. If that light were not at once intercepted part of it would, by the movement of the frame, begin to pass across the line of cut-off, so as to be seen within the danger-arc. By this continued reciprocative movement of the screen as lens after lens comes round, the same effect will be successively produced, and the light will always be cut off in the line of obscuration as sharply as in the case of a fixed light, so that the flashes will never be seen within the danger-arc.

In cases where the light has to be cut off on both sides of a danger-arc a similar reciprocating screen is as applicable to the lenses when passing out as when passing into the danger-arc. But in this case the lens, on leaving the danger-arc, will take the screen round with it up an inclined plane until the axis of the lens is parallel to the line of cut-off, when the screen will recoil and the light become visible with full power in the line of cut-off.

A small spherical mask placed inside of the apparatus may be made to produce the same effect by reciprocating between the lenses and the flame. When the danger-arc is of small amplitude the screens, which must always be as broad as the lens, might come in the way of the light passing over the safety-arcs. To obviate this, cloth curtains might be made to wind up on vertical rollers similar in construction to those used for ordinary house-blinds.

THOMAS STEVENSON

CHLOROPHYLL[1]

AN account was given in NATURE, vol. xxi., p. 85, of Prof. Pringsheim's first publication on this subject. He had then found that exposure to intense light for a few minutes causes the chlorophyll-corpuscles contained in the cells of plants to lose their green colour; he also pointed out that this effect is produced not by heat but by light, and only in the presence of oxygen, and further, that the highly refrangible rays of the spectrum are those which are principally concerned in it. He also announced the discovery in the chlorophyll-corpuscles of a substance termed Hypochlorin.

The paper now under consideration gives a full account of all the observations and experiments which he has made up to the present time, and he considers that they tend to confirm the conclusions at which he had previously arrived. It will be well, before entering upon a discussion of the very difficult questions which are raised, briefly to enumerate the principal new facts which he now brings forward.

In the first place, he is able to throw some light upon the intimate structure of chlorophyll-corpuscles by means of a new method for investigating them. This method consists in treating them with a dilute acid (*e.g.* 1 vol. of glacial acetic acid to 2 of water, or 1 vol. of picric acid to 3-6 of water, or 1 vol. of sulphuric acid to 20-40 of water, or 1 vol. of strong hydrochloric acid to 4 of water), or warming them in water, or exposing them to the action of steam. The effect of this treatment is to cause the escape of the chlorophyll from the corpuscle, together with certain fluid or semi-fluid substances which accompany it, in the form of viscid drops, leaving the ground-substance of the corpuscle as a colourless, apparently protoplasmic, hollow sphere, with a much perforated wall.

These viscid green drops, when produced by the action of warm water or of steam, appear to consist of an oil which holds the chlorophyll and other substances in solution. When they are produced by means of a dilute acid, they appear to contain a substance which is not present when they are extracted by warm water or by steam. Certain dark brown masses make their appearance which are of a tolerably firm consistence and of varying form. These gradually become harder, and assume a crystalloidal appearance, probably, as Prof. Pringsheim suggests, in consequence of a conversion into resin of the oily matter which is present; but it is by no means the whole of the substance which thus solidifies, but only a certain constituent of it. The colour of the mass is doubtless due to the presence of altered chlorophyll, and this may affect even the crystalloids, but they may be obtained colourless. It is to the substance which assumes the crystalloidal form, or rather to some substance pre-existent in the chlorophyll-corpuscle from which these crystalloids are derived by the action of the acid, that Prof. Pringsheim gives the name of Hypochlorin.

He meets the doubts that may arise as to the chemical individuality of this substance, as also the suggestion that it may be a product of the alteration of the chlorophyll, by pointing out that it cannot usually be obtained at any one time from all the corpuscles of a given cell. It is therefore a substance which, as it is present in some and not in others, cannot be derived from chlorophyll which is present in them all, and which probably bears some definite relation to the metabolic processes going on in the corpuscles.

Since no hypochlorin can be obtained from cells which have been warmed in water or acted upon by steam, it appears that this substance is decomposed by heat.

After giving a detailed description of the arrangement of the apparatus used in his observations, Prof. Pringsheim goes on to give an account of the effects produced by exposure to intense light in the different parts of which the cell consists. He again insists that none of the following phenomena can be the results of excessive heating of the object, for he found that cells not containing chlorophyll (*e.g.* colourless zoospores) could bear the exposure for half-an-hour without injury, and further, that the phenomena were produced more readily by blue or green light than by red light which has a much greater heating effect. The principal phenomena observed are as follows:—

1. The colouring-matter.

The chlorophyll-corpuscles lose their colour in a few minutes, but this does not take place when oxygen is not present, nor in red light. There is no trace of chlorophyll left in the corpuscles. Prof. Pringsheim is therefore of opinion that its decolorisation is a phenomenon of oxidation, and that the products are gases. Further, this disappearance of the chlorophyll is not prevented by the absence of carbonic acid gas. The corpuscles which have lost their green colour do not regain it, although the cell in which they are contained, still continues to live; on this account Prof. Pringsheim regards the decomposition of chlorophyll as a pathological and not as a normal process.

Colouring matters, other than chlorophyll, which occur in the cells of plants, are likewise decomposed, but not all of them. Thus, the blue pigment of the Phycochromaceæ, the brown of Fucus, the red of the Florideæ, the orange of the corolla of Calendula, the blue in the cells of the staminal hairs of *Tradescantia virginica*, disappear, but the blue pigment in various flowers is not decomposed by exposure to intense light.

2. The ground-substance of the chlorophyll-corpuscles and their contents.

If a cell of Nitella or of Spirogyra be killed by the action of heat, for instance, the chlorophyll-corpuscles of the one and the spiral band of the other will absorb water and swell up. If the cell has been killed by prolonged exposure to light, no such absorption of water will take place.

---

[1] "Untersuchungen uber Lichtwirkung und Chlorophyllfunction in der Pflanze," by Prof. N. Pringsheim (*Jahrbucher fur Wiss. Bot.*, Bd. XII., Heft 3. Leipzig, 1881).

Prof. Pringsheim mentions starch, oil, and tannin as commonly occurring in the chlorophyll-corpuscles[1]; these substances, which contain a considerable proportion of oxygen in their molecule, are not affected by the action of light.

3. Hypochlorin.

No trace of this substance can be detected in cells which have been exposed.

4. The protoplasm of the cell.

The turgidity of exposed cells is lost; the protoplasm readily allows colouring matters to pass through it, and treatment with plasmolytic reagents produces no contraction. In a long cell, part of which has been exposed to the action of light, it is only the portion of the protoplasm which has been exposed that exhibits these alterations in its properties. Moreover, these changes are apparently accompanied by a perceptible loss of substance.

A brief exposure causes an arrest of the rotatory movements of the protoplasm in cells which exhibit it. If the exposure has not been prolonged, these movements will recommence after a time. If a portion only of such a cell be exposed for not too long a time, the movements will be arrested in the exposed portion, whereas it continues in the rest of the cell.

5. The cell-wall.

The only effect which the exposure produced on cell-walls appears to have been that the cells of the more delicate filaments of species of Spirogyra and Mesocarpus become isolated.

The following are the general conclusions which Prof. Pringsheim draws from the facts which have been stated above. He concludes that the injurious effects produced by the exposure of a cell to intense light in an atmosphere containing oxygen, are due to an increased oxidation of certain substances which are essential to its life. The rays which are active in this process are not those which reach the interior of the cell after having passed through the chlorophyll-corpuscles, but those which reach it directly. He finds, it is true, the cells which do not contain chlorophyll are, on the whole, less sensitive to the action of light than those which do contain it, but there are no grounds for believing that this greater sensitiveness is due to the absorption of any light-rays by the chlorophyll. On the contrary, the presence of chlorophyll in a cell seems rather to diminish than to increase the oxidising action of light. Facts are adduced to show that chlorophyll exercises a protective influence in this respect, and it is further pointed out that the death of the cell, when exposed to intense light, takes place *before* the complete decolorisation of the chlorophyll-corpuscles has been effected. The greater sensitiveness to the action of light of a cell containing chlorophyll is ascribed to the presence in it of the readily-oxidisable products of its assimilatory activity, and of these hypochlorin is the most important.

Prof. Pringsheim's theory of the function of chlorophyll is, then, (1) that the respiration of a cell is increased by exposure to light; (2) that, in consequence of the absorption which takes place when light passes through chlorophyll, the presence of chlorophyll in a cell tends to counteract the influence of light, so that, when the light is not intense, the respiration of the cell is so far diminished that processes of reduction can take place within it, but when the light is very intense the chlorophyll itself undergoes decomposition, and the death of the cell is brought about by the excessive oxidation of certain of its essential constituents.

After having stated his own views, Prof. Pringsheim proceeds to criticise the current hypotheses concerning the function of chlorophyll. The first of these is the one according to which chlorophyll is itself converted into carbohydrate in the assimilatory process. It is not easy to understand, from a chemical point of view, how such a conversion can be effected in the plant, and it becomes quite impossible when it is shown, as Prof. Pringsheim has done, that chlorophyll does not undergo any perceptible change when it is exposed to light in an atmosphere containing carbonic acid but no oxygen. The second relates to the absorption-spectrum of chlorophyll. The question naturally arises as to whether or not the rays which chlorophyll absorbs are those which effect the reduction of carbonic acid and water in the chlorophyll-corpuscle. That it must be answered in the negative is clear when it is borne in mind that the maximum, of the decomposition of carbonic acid does not coincide with the maximum of absorption in the chlorophyll-spectrum. From what source, then, is the energy derived which is necessary for this reduction? It is derived, according to Prof. Pringsheim, from light-rays absorbed, not by the chlorophyll, but by the other cell-contents. He is of opinion that the chlorophyll takes no direct part in this process.

The next question which is dealt with is the existence of an optimum intensity of light for the decomposition of carbonic acid. Prof. Pringsheim does not consider that this is the intensity which effects the greatest evolution of oxygen, for, from his point of view, the amount of oxygen given off at any time is the resultant of the action of two distinct processes, respiration and assimilation, both of which are affected by the intensity of the light. He concludes that, so far as an actual gain of carbon is concerned, there is no general optimum intensity. He applies this mode of reasoning also to the question of the relative activity of the different rays of the spectrum in the process of assimilation. The green and yellow rays have been found to be more active than the blue, because, as he points out, they are not absorbed to the same extent by the chlorophyll, and not because they are endowed with any special reducing power. Finally, he proceeds to the discussion of the fact that the volume of an atmosphere in which green plants are exposed to light remains constant. This fact has led to the conclusion that, since the volume of carbonic acid decomposed and of oxygen exhaled is the same, the substance formed in the process is a carbohydrate. Prof. Pringsheim's inference from this fact is very different. He argues that since oxidation and reduction are going on simultaneously, the substance formed contains a smaller quantity of oxygen than a carbohydrate,—in fact a quantity which is smaller by just that amount of oxygen which has been used up in respiration.

Stated in the briefest possible manner, Prof. Pringsheim's principal results are as follows:—

1. That the presence of chlorophyll favours the assimilatory activity of the chlorophyll-corpuscle in consequence of the absorption, by the chlorophyll, of light, which would promote the respiratory activity.

2. That hypochlorin is the substance which is the first visible product of this assimilatory activity, and that the other substances (starch, glucose, oil, tannin) which are found in chlorophyll-corpuscles are derived from hypochlorin by oxidation. This conclusion is based upon the general occurrence of hypochlorin in chlorophyll-corpuscles, upon the fact that the amount of hypochlorin in a corpuscle varies inversely as the quantity of starch which is present, and upon the observation that hypochlorin cannot be detected in seedlings until they have been exposed to light of such an intensity as to enable them to assimilate.

It is of interest to note that hypochlorin makes its appearance at the later stages of germination in seedlings of various species of Pinus which have grown in the dark, inasmuch as it has long been known that these plants become green in darkness.

---

[1] He quotes the observations of Briosi to prove that oil, and not starch, is the substance which is formed in the chlorophyll-corpuscles of the Musaceæ, without being aware, apparently, that Briosi's results have been shown to be incorrect by Holle and Godlewski ("Flora," 1877).

This paper cannot be regarded as other than a most important contribution to our knowledge of the physiology of plants, and it will be readily admitted that Prof. Pringsheim's theory of the function of chlorophyll is at least as satisfactory as any which are now current. But although the number of facts upon which the theory is based is large, yet the evidence in favour of it can hardly be considered to be complete at present; there are certain points which require further elucidation. For instance, Prof. Pringsheim regards the chlorophyll of a corpuscle as undergoing no change under ordinary circumstances, but it is difficult to reconcile this view with the fact that an alcoholic solution of chlorophyll loses its colour under the same circumstances. Then again, as to the source of the reducing energy in the process of assimilation, if the rays absorbed by the chlorophyll are not directly concerned in it, it is most desirable that more information should be obtained as to the nature of the rays which are active, and as to the particular cell-contents which absorb them. Further, the correctness of the principle that an increase in the intensity of light to which a cell is exposed produces an increase of its respiratory activity, needs more direct and general experimental confirmation than is given here. In his views as to the respiratory function, he appears to insist too strongly that the chlorophyll-corpuscles are to be regarded not only as assimilatory, but also as respiratory organs. It is not easy to see that any of the observations which he gives in this paper directly suggest such a view; on the contrary, they tend rather to show that exposure to intense light increases oxidation in the *whole* of the protoplasmic cell-contents. Prof. Pringsheim evidently desires to bring out that hypochlorin is *the* substance which undergoes oxidation in the cell, and since it is present exclusively or nearly exclusively in the chlorophyll-corpuscles, he considers that these bodies are the especial seats of the respiratory process. His observations, however, do not warrant this conclusion; what they prove is that the hypochlorin in the chlorophyll-corpuscles is oxidised when they are exposed to intense light in an atmosphere containing oxygen, and that certain changes (including a loss of substance) take place in the rest of the protoplasm, in consequence, doubtless, of the excessive oxidation of some substance or substances which it contains. His view may be fairly met with the *à priori* objection that it is highly improbable that the same organ should be the seat of two such opposite functions as respiration and assimilation. The true physiological significance of the chlorophyll-corpuscles becomes apparent when it is borne in mind that assimilation does not take place in cells which do not possess them, whereas respiration proceeds actively, perhaps most actively, in such cells.

And, finally, as to hypochlorin, it is to be hoped that a method will be devised for the extraction of this substance in such quantities as to allow its properties to be studied and its chemical composition to be ascertained. The curious fact that hypochlorin cannot be detected in plants which are not distinctly green (Diatomaceæ, Fucaceæ, &c.), is worthy of further investigation.

These desiderata may perhaps be supplied in the future publications on this subject which Prof. Pringsheim promises.

SYDNEY H. VINES

NOTES

We take the following from the *Times*:—At their meeting last week the President and Council of the Royal Society selected, from the whole number of fifty-two candidates for the fellowship, the following fifteen to be recommended to the Society for election at the annual meeting on June 2 next:—W. E. Ayrton, H. W. Bates, J. S. Bristowe, W. H. M. Christie, G. Dickie, A. B. Kempe, A. Macalister, H. McLeod, J. A. Phillips, W. H. Preece, B. Samuelson, M.P., B. B. Stoney, R. H. Traquair, Rev. H. W. Watson, C. R. A. Wright.

A *conversazione* of the Society of Telegraph Engineers was held in honour of Prof. Helmholtz in the rooms of University College on Monday night. Among those who were present to meet the guest of the evening were many eminent English men of science. Many of the members of the Society and other had lent instruments and apparatus showing some of the purposes to which electricity has recently been applied, and also the means by which electrical research is still being carried on. On entering the College grounds the visitors saw a very pretty effect caused by one of Mr. Crompton's electric lights, which had been placed on the top of the portico. The reception-room itself was lit up with little incandescent electric lamps on Mr. Swan's principle. They were arranged in bunches of three or four in ground glass globes suspended from the ceiling, and in fact at first sight they looked like very brilliant gas-burners, no wires being visible. On each side and down the centre of the room were placed tables on which were arrayed all the newest inventions in electrical science. On one it was demonstrated how perfectly easy it was to manage Mr. Swan's lamps; taking one lamp out of the stand and putting in a new one occupying only a few seconds, there being no binding-screws or switches to attend to. Perhaps the most interesting experiment of the evening was the transmission of pictures of natural objects by telegraph, the picture of a butterfly being most beautifully transmitted by means of a selenium plate. This was shown by Mr. Shelford Bidwell's telephotographic machine. Mr. Latimer Clark exhibited some rare books on electricity and magnetism, autographs and portraits of eminent electricians; also a portion of the original telegraph line which was laid by the late Sir Francis Ronalds in 1816, with the original model of Ronalds' telegraph, the original type cast for the Morse telegraph, with autograph of Prof. Morse, and a portion of line laid by W. F. Cooke in 1837. Mr. Cotterell of the Royal Institution exhibited a very delicate mercury electrometer on Lippman's principle, belonging to Prof. Dewar; and Mr. Robert Sabine performed some pretty experiments illustrating the cause of the motion of the mercury. Mr. Stroh showed the beautiful apparatus made by him to illustrate Prof. Helmholtz's vowel theory, and Mr. Preece performed several experiments in explanation of the remarkable sounds produced by intermittent light on solid, liquid, and gaseous matter. Mr. George Lund, of the firm of Messrs. Lund and Blockley, exhibited some synchronous clocks for the London, Chatham, and Dover Railway Company for coupling up two ordinary telegraph lines at 10 a.m., in order to send the time current. They also applied to the clock a novel automatic arrangement of their own invention, by which, at two minutes to 10 a.m. daily, the current will ring a warning bell, couple up and block against false currents two ordinary telegraph wires, then at 10 a.m. the clock sends the time-current of two seconds' duration, giving time to the clocks in circuit. Immediately upon the termination of the two seconds' current the lines will be automatically re-established as distinct lines for their ordinary telegraph purposes. All present were pleased to have the opportunity of inspecting Prof. Kennedy's engineering laboratory, where the machine for testing the strength of materials up to fifty tons was seen in operation, and various pieces of brass and copper were tested. The machine-tools were in operation, and a steam-engine of peculiar construction driving them. We look forward with interest to the scientific results we may expect to be brought to light with the testing-machine. The President (Prof. Carey Foster) showed some interesting electrical instruments; Mr. Richard Anderson a portable galvanometer for testing lightning-conductors; Professors Ayrton and Perry a variety of apparatus, as also Siemens Brothers, Newall and Co., and others. Prof. Helmholtz ended on Tuesday his visit to London, and went with Mr. Spottiswoode, president of the Royal Society, to his country house at Coombe Bank, Sevenoaks. From thence he proceeds to Dublin to receive an honorary doctor's degree from the University of that city.

THE National Fisheries Exhibition will be opened at Norwich by the Prince of Wales on the 18th inst. The delay in opening it has been caused by the necessity for enlarging the space to admit of satisfying the numerous applications that have poured in. Every point connected with the growth and nurture of fish, the modes of capturing them, the condition of the fishermen will be illustrated. The aquatic fauna of Norfolk and Suffolk will be a special feature, as also fish-eating birds. The Earl of Ducie, Viscount Powerscourt, Lord Lovat, Mr. Spencer Walpole, and Prof. Huxley, H.M. Inspectors of Fisheries; and Mr. Calcraft, Permanent Secretary to the Board of Trade, have been appointed by the Home Secretary to act as Her Majesty's Commissioners. In addition to a large number of special money prizes, Government gold, silver, and bronze medals, diplomas of honour, will be awarded by the jurors. Prof. Huxley will give an address on the occasion.

MUSEUM No. 1 in the Royal Gardens, Kew, will be reopened to the public on Easter Monday, after being closed during the winter. It has been enlarged by the addition of a new wing, terminating in a wide staircase with ascending and descending flights. The expense has been borne by the India Office in consideration of the maintenance at Kew of the botanico-economical collections recently forming part of the India Museum. The whole collections have been entirely re-arranged by the curator, Mr. John Jackson, A.L.S. On the staircase has been placed a large painted window, presented to the museum by Alderman W. J. R. Cotton, M.P. This window represents the successive stages of cotton cultivation and manufacture. Amongst other recent additions to the museum may be mentioned a series of models of farm and garden vegetables prepared and presented by Messrs. Sutton of Reading; a collection formed by Col. Pearson, who has charge of the Indian forest-students at Nancy, of the various objects manufactured in France from native-grown woods; a further series of vegetable products and manufactured articles, collected in Afghanistan by Surgeon-Major Aitchison. The collection of portraits of botanists has also been much enlarged and re-arranged. An oil portrait of Thomas Andrew Knight, F.R.S., well known for his classical researches in vegetable physiology, has been presented on behalf of the family by Sir Charles Rouse Boughton, Bart.

THE President of the United States of America has notified to the French Government his intention of appointing a special commission to preside over the arrangement of the American Section at the Electrical Exhibition. A number of commissioners have been already selected for the purpose. M. Phillippart has written to M. Berger, placing at his disposal a sum of 4000*l*. for the best system presented of transporting electric force at a distance.

ON Sunday week a deputation composed of eminent representatives of French science waited upon the venerable M. Milne-Edwards to present him with a medal in commemoration of the completion of the great naturalist's work on Comparative Physiology and Anatomy. Warm congratulatory addresses were made by MM. Quatrefages, Blanchard, and Dumas, the last speaking of himself as the oldest of M. Milne-Edward's friends. In thanking the deputation the recipient of this well-earned honour was naturally much moved.

ON March 26, in presence of the Minister of the Interior, the Commission of the Observatory, several State functionaries and men of science, there were repeated at the Brussels Observatory experiments with Van Rysselberghes' telemeteorograph, which prove that the registration of the meteorological elements by this instrument may be made automatically at very great distances (several hundred kilometres). The author explained to the Minister a plan of International Telemeteorography, the realisation of which would be of the greatest utility for the scientific study of the atmosphere, and which would render possible the prevision of the weather.

THE destruction caused by the Chios earthquake has been even greater than we stated last week. The Constantinople Correspondent of the *Daily News* sends some interesting particulars: The temperature on the 3rd was heavy and oppressive, and the horizon was broken by broad flashes of light that seemed to denote a coming storm. In all this atmospheric disturbance however the inhabitants saw nothing extraordinary, and were far from being alarmed by what they fancied would result in a thunderstorm. At ten minutes to two in the afternoon a terrific shock was felt, bringing three-fourths of the houses in the town to the ground like so many packs of cards, and burying a thousand persons under the falling ruins. Then commenced a fearful scene of horror. The ground rocked and danced, kneading the ruin already formed into an unrecognisable mass of stone. The survivors ran hither and thither, not knowing where to flee to escape the horrible fate that menaced them, and were tossed and flung about by the heaving earth, like feathers in a breeze. Even those who gained the open country were by no means safe. The earthquake attacked not only the towns and villages, but worked its ravages in the hills and mountains of the island. Enormous masses of rock and earth came rushing down the hill-sides, carrying all before them, bounding far into the plains, and tearing roads in the solid rocks of the mountain such as might have been formed by a torrent a thousand years old. The town presented a pitiable spectacle. Great fissures and crevices yawned in the streets, walls were falling with a crashing report, and entire buildings crumbled in fragments to the ground. In many places whole streets had disappeared, and it was hard to say where the different well-known buildings had stood. The ground still heaved and tossed, bringing fresh buildings to the ground at every moment, and hurrying innumerable victims to destruction. It is impossible to say what the number of victims would have been if a second shock had not displaced the ruins formed by the first and thus permitted thousands of sufferers to escape or to be rescued by others from the horrible imprisonment to which they had been condemned. All the fissures and crevices run from east to west. In the country the effects of the horrible upheaval have been even more terrible than in the town. The shocks are now, April 8, diminishing. In all there were counted 250 since the first three awful upheavals which destroyed the greater part of the island. A telegram of the 12th states that earthquake shocks of considerable violence have recommenced in Chios, and it is estimated that barely twenty houses now remain habitable in the whole island. Forty-five villages have been totally destroyed, and in many localities the population has absolutely disappeared.

SOME slight shocks of earthquake were felt on the morning of the 5th inst. at San Cristobal, Cuba. A violent shock was felt at two o'clock on Sunday morning throughout the centre of California. Earthquakes were reported from South Hungary on Wednesday last week.

THE *Daily News* Naples correspondent, telegraphing on the 6th, states that Mount Vesuvius was displaying greater activity. Abundant streams of lava were descending northwards, and great numbers of smoke fissures had opened round the crater, some at 100 metres distance from the centre of eruption.

Prof. C. V. Riley has just published, in the Second Report of the United States Entomological Commission, "Further Facts about the Natural Enemies of Locusts," meaning, of course, by the latter term, the Rocky Mountain pest in particular. His observations entirely concern insect parasites. The most interesting are on the habits of two species of *Diptera*, allied to *Bombylius*, the larvæ of which feed on the eggs of "locusts." The plate (xvi.) illustrating the subject is above praise, not only on account of the scientific accuracy shown in the drawings (which are by the author), but also as regards the reproduction of them by the "lithocaustic" process adopted by a Baltimore firm. We have seen other plates of entomological subjects emanating from the same firm, and the impression formed on our mind is that no other process is equally adapted for the purpose. Why cannot some of our own enterprising "lithographers" produce the same result?

The following are the lecture arrangements after Easter, at the Royal Institution:—Prof. Dewar, M.A., F.R.S., six lectures on the Non-Metallic Elements, on Tuesdays, April 26 to May 31; Prof. Tyndall, D.C.L., F.R.S., six lectures on Paramagnetism and Diamagnetism, on Thursdays, April 28 to June 2; Prof. H. Morley, three lectures on Scotland's Part in English Literature, on Saturdays, April 30, May 7, 14; one lecture on Thomas Carlyle, on Tuesday, June 7; Mr. E. C. Turner, Lector at the University of St. Petersburg, five lectures on the Great Modern Writers of Russia, on Saturdays, May 21, 28, June 4, Thursday, June 9, and Saturday, June 11. The Friday evening meetings will be resumed on April 29, at 8 p.m. Prof. J. S. Blackie, F.R.S.E., will give a discourse on "The Language and Literature of the Scottish Highlands," at 9 p.m. Succeeding discourses will probably be given by the Hon. G. C. Brodrick, Mr. Francis Galton, Mr. W. H. Pollock, Prof. H. E. Roscoe, Prof. W. G. Adams, and Prof. Dewar.

The usual course of Mayfair Lectures will commence, under the auspices of the National Health Society, on Friday, April 22, at 23, Hertford Street, Mayfair. The list of lecturers will this year include the names of Dr. Siemens, F.R.S., Dr. Robert Farquharson, M.P., and Prof. Fleeming Jenkin.

We are glad to find from an announcement in the current number of the *Quarterly Journal of Microscopical Science* that Dr. C. T. Hudson, of Manilla Hall, Bristol, is preparing a volume for the Ray Society on the "British Rotifers." Dr. Hudson is known not only for his numerous contributions to our knowledge of this group, but especially for his discovery and excellent illustrations of one of the most important members of the group (Pedalion). Dr. Hudson will have the advantage of the use of Mr. P. H. Gosse's beautiful drawings of Rotifers, which that observer has placed at his disposal.

A large party of the Members of the Geologists' Association were on Saturday last conducted through the Geological Department of the British Museum (Natural History), South Kensington, by Dr. Henry Woodward, F.R.S., &c., the Keeper of that Department.

Apropos of the meeting of the French Association at Algiers the *Revue Scientifique* for April 9 devotes most of its space to a series of articles on Algeria, its colonisation, statistics, botany, anthropology, hygiene, and zoology.

The additions to the Zoological Society's Gardens during the past week include a Macaque Monkey (*Macacus cynomolgus*) from India, presented by Mr. R. J. Short; a Common Paradoxure (*Paradoxurus typus*), from India, presented by Mr. C. W. C. Fletcher; a Viverrine Cat (*Felis viverrina*) from India, presented by Major C. R. Oxley; two Squirrel-like Phalangers (*Belideus sciureus*) from Australia, presented by Mr. D. W. Barker; three Paradise Whydah Birds (*Vidua paradisea*), a Pin-tailed Whydah Bird (*Vidua principalis*), a Red-shouldered Weaver Bird (*Urobrachya axillaris*), a Red-beaked Weaver Bird (*Quelea sanguinirostris*), a Wiener's Finch (*Pytelia wieneri*), two Yellow-rumped Seed-Eaters (*Crithagra chrysopyga*) from Mozambique, presented by Mr. Maurice C. Angel, F.Z.S.; two Laughing Kingfishers (*Dacelo gigantea*) from Australia, presented by Mr. Edward Trelawny; an Alexandrine Parrakeet (*Palæornis alexandri*) from India, presented by Mr. Henry Day; a Common Gannet (*Sula bassana*), British, presented by Mr. G. Randall; a Common Marmoset (*Hapale jacchus*) from South America, deposited; an Indian Chevrotain (*Tragulus meminna*) from India, six Weeper Capuchins (*Cebus capucinus*) from Brazil, four Chestnut-eared Finches (*Amadina castanotis*) from Australia, three Common Crowned Pigeons (*Goura coronata*) from New Guinea, an American Tantalus (*Tantalus loculator*) from South America, purchased; two Sclater's Curassows (*Crax sclateri* ♂ ♀) from South America, on approval; an Indian Darter (*Plotus melanogaster*) from India, received in exchange.

GEOGRAPHICAL NOTES

The Royal Medals of the Geographical Society have this week been awarded as follows:—The Founder's Medal to Major Serpa Pinto, "for his remarkable journey across Africa, from Benguela to Natal, during which he explored nearly 500 miles of new country, defined the fluvial systems of the southern slopes of the Benguelan Highlands, and fixed the position of numerous places by a series of astronomical observations; also for the admirable account of his journey, now in course of publication in London, containing numerous original maps, tables of observations, and a large amount of valuable and exact information regarding the African interior;" and the Patron's Medal to Mr. Benjamin Leigh Smith, for his discoveries on the south coast of Franz-Josef Land during last summer, as well as for his previous expeditions along the north-east land of Spitzbergen.

At the meeting of the Geographical Society on Monday last Mr. R. N. Cust read a paper by Col. Tanner on Kafiristan and the Siah-posh Kafirs of the Hindu Kush. The paper, which was hardly a geographical one in any sense, dealt chiefly with the inhabitants of the Valley of Dara Nur and the Chugan tribe, and to a less extent with the Kafirs, who are called "Siah-posh" from their wearing black clothes, and furnished some very interesting information regarding their manners and customs. Some philological notes had also been sent by Col. Tanner, but these will be communicated to the Asiatic Society. Some of the more striking passages in Col. Tanner's notes, if we remember rightly, were read at the Swansea meeting of the British Association. As much interest attaches to Kafiristan and the Kafirs, and the results expected from Col. Tanner's expedition were so eagerly looked forward to, it was rather disappointing to be told by Col. Yule that we have even now learned no more than was buried in the record of a Jesuit Missionary's travels some 200 years ago. No doubt had his health not failed at the critical moment, and compelled him to return to India, Col. Tanner would have succeeded in penetrating into Kafiristan itself, and collected valuable geographical information.

The Society formed at Milan for commercial exploration in Africa is showing increased activity, and has despatched another expedition to Tripoli, under the command of Capt. Camperio, who is accompanied by Signor Cingia, an ex-cavalry officer. The principal objects of this expedition are the exploration of the Gulf of Bomba, and it will particularly examine the ports of Tobruck and Derna, not far from the Egyptian frontier. Capt. Camperio will afterwards make an attempt to penetrate into the interior of the oasis of Jarabud, in order to open commercial relations with its inhabitants.

We are glad to learn that there is good hope that Col. Flatters and many of his followers, who were reported to have been massacred by the Touaregs, are still alive, though probably retained as prisoners.

Doctors Schweinfurth and Riebeck, who have been travelling in Egypt, left Cairo last month to explore the island of Socotra. They do not seem to be aware that quite recently

Prof. I. B. Balfour visited the island on behalf of our Zoological Society.

THE April number of *Petermann's Mittheilungen* has a long article, with map, on Mr. A. Forrest's expedition through North-West Australia in 1879; Herr Clemens Denhardt continues his paper on Researches in Equatorial East Africa; Herr F. v. Stein gives details on the new French land fortifications, with map, and there are several interesting letters from Dr. Junker, on his experiences in the Niam-Niam country.

No. 2, for 1880, of the *Bulletin* of the American Geographical Society contains an unusually interesting paper by Prof. J. B. M'Master, of Princeton College, on the Bad Lands of Wyoming, in which he endeavours to trace out their geological history; Mr. B. R. Curtis describes his journey round the world; and there is a historical article on Arctic Exploration by the Rev. B. F. De Costa.

THE *Bulletin* of the Antwerp Geographical Society (tome v. fasc. 6) contains a paper of considerable value by the Abbé van den Gheyn, on the present state of research with regard to the primitive cradle of the Aryan race. M. A. Baquet contributes a paper on the fauna and the chace in the countries of South America watered by the Paraguay and the Parana.

CHEMICAL NOTES

B. HEINDL has recently made investigations into the compounds of calcium chloride with ethyl alcohol, isobutyl alcohol, and amyl alcohol, and has obtained the following formulæ:—

$CaCl_2 . 3(C_2H_6O)$; $CaCl_2 . 3(C_4H_{10}O)$; and $CaCl_2 . 3(C_5H_{12}O)$.

IN continuation of his investigation of the action of hydrochloric acid on metallic chlorides, already referred to in these notes, M. Ditté describes several new compounds of this acid with mercuric chloride, viz.,

$$2HgCl_2 . 4HCl . 7H_2O : 3HgCl_2 . 4HCl . 7H_2O :$$
$$2HgCl_2 . HCl . 6H_2O : 4HgCl_2 . 2HCl . 9H_2O : \text{ and}$$
$$3HgCl . HCl . 5H_2O.$$

MM. FOUQUÉ AND LÉVY describe (in *Compt. rend.*) the artificial preparation of the basaltic minerals peridote and labradorite, by prolonged heating of a homogeneous mixture of the constituents of a basalt rich in olivine.

DR. A. R. LEEDS has recently examined the action of nitrogen tetroxide—N_2O_4—on various hydrocarbons (*Journ.* of American Chem. Soc.). The results are interesting, and promise to be even more so. Benzene, when acted on by N_2O_4 yields mononitro-benzene, picric acid and oxalic acid; two other compounds were also obtained, but under conditions which have not been successfully realised a second time. One of these the author calls monoxy-benzene—C_6H_4O—an isomer or metamer of quinone; the other has not been purified. Naphthalene yields mononitro-naphthalene, α and β dinitro-naphthalene, and two compounds which, so far as they have been examined, appear to be naptho-diquinone, $C_{10}H_4O_4$, and tetroxy-naphthalene, $C_{10}H_8O_4$. The products of the action of nitrogen tetroxide on cymene are chiefly a nitrocymene (probably also a dinitro-derivative) and paratoluic acid.

THE American Chem. Soc. *Journal* (vol. i. Nos. 11 and 12) contains an interesting historical sketch of the lines of discovery of ozone, and of peroxide of hydrogen, by Dr. A. R. Leeds; to these papers is added a full list of references to all publications on ozone and hydrogen peroxide; the ozone references occupy thirty-two pages, and the hydrogen peroxide, ten pages.

AN important paper by M. Étard—important both by reason of the results obtained and because of the nature of the problem attacked—on the oxidising action of chromyl dichloride, appears in *Annales Chim. et Phys.* for February. M. Étard has studied the mechanism, so to speak, of the chemical changes which occur when chromyl dichloride acts as an oxidiser; he finds that in the case of the hydrocarbons containing methyl groups attached to an "aromatic" nucleus the methyl groups are transformed into the aldehydic group (COH), and that when the aromatic nuclei are themselves attacked, quinones are produced. The chromyl dichloride forms compounds with the aromatic hydrocarbons, which may be formulated as $X . 2CrO_2Cl_2$ (where X = hydrocarbon): these compounds are then decomposed by water, and yield the products already mentioned.

IN the same journal there is a lengthy and interesting paper by M. W. Spring on the effects of great pressure on solid bodies. It is shown in this paper—which is chiefly physical—that the particles of crystalline bodies tend to solder themselves closely together at high pressures, the effect of pressure being analogous to that of fusion; and that amorphous bodies may be divided into two classes, viz. those which behave similarly with crystalline bodies, and those which are not thus affected by high pressures.

THE influence of pressure on chemical changes is also considered, and it is shown that as a general rule a chemical change which results in the production of a system the volume of which is less than the volume of the initial system, may be brought about by subjecting the initial system to great pressure, but that if the change involves an increase of volume, pressure alone does not cause the change to proceed.

M. BRAME describes (in *Compt. rend.*) experiments on animals with pure hydrocyanic acid, the results of which seem to show that the bodies of animals killed by this acid (pure) do not undergo decomposition even when kept for a month; that the acid remains during that time in the animal tissues, and notably in the stomach, and that the acid is readily obtained by distillation from the tissues of a herbivorous, but much less readily from those of a carnivorous animal.

IN continuing his researches on chemical affinity Herr Ostwald (*Journ. fur pract. Chem.*) has made the remarkable observation that while the solvent action of polybasic acids on salts is diminished by the presence of the normal salts of the acids employed, the solvent action of monobasic acids is considerably increased by the presence of the normal salts of these acids. In his third paper Herr Ostwald gives a large series of measurements which show that the solvent action of free nitric or hydrochloric acid on calcium or zinc oxalate is increased by addition of potassium, sodium, ammonium, or magnesium nitrate or chloride. The solvent action increases proportionally to the increase in the quantity of normal salt added. Ostwald confesses that he can as yet give no thoroughly satisfactory explanation of this phenomenon; the explanation which appears at present most probable involves the assumption that there is a slight chemical action between the normal salt (potassium nitrate, &c.) and the salt which is being dissolved by the acid (calcium or zinc oxalate): this small chemical change alters the "stability" of the whole system, and so increases the amount of the primary change, *i.e.* solution of calcium oxalate, &c., in a given time.

FROM thermochemical data J. Thomsen regards the generally accepted formula for benzene as incorrect. The number obtained by him for the heat of combustion of benzene (805,800 thermal units) agrees fairly well with that calculated (800,400), on the assumption that all the carbon atoms in benzene are 'singly-linked." The heat of combustion of the metamer of benzene, viz. dipropargyl, is, according to Berthelot, 853,600 units; Thomsen's caculations, assuming the formula

$$HC{\equiv}C{-}CH_2{-}CH_2{-}C{\equiv}CH$$

to be correct, give the number 888,400. The formula above given for dipropargyl is therefore probably correct.

IN the last number of the German Chemical Society's *Berichte* are published some recent observations on dipropargyl by Henry, the discoverer of this curious compound. He describes, but not yet in any detail, a solid polymer produced by the action of heat on dipropargyl. He also describes the tetriodide $C_6H_6I_4$, and the octobromide $C_6H_6Br_8$.

THE arguments in favour of the number 240 being adopted as the atomic weight of uranium have been strengthened by the preparation by C. Zimmermann (*Berliner Berichte*) of the normal uranate of lithium, Li_2UO_4, analogous with the normal chromates, tungstates, and molybdates.

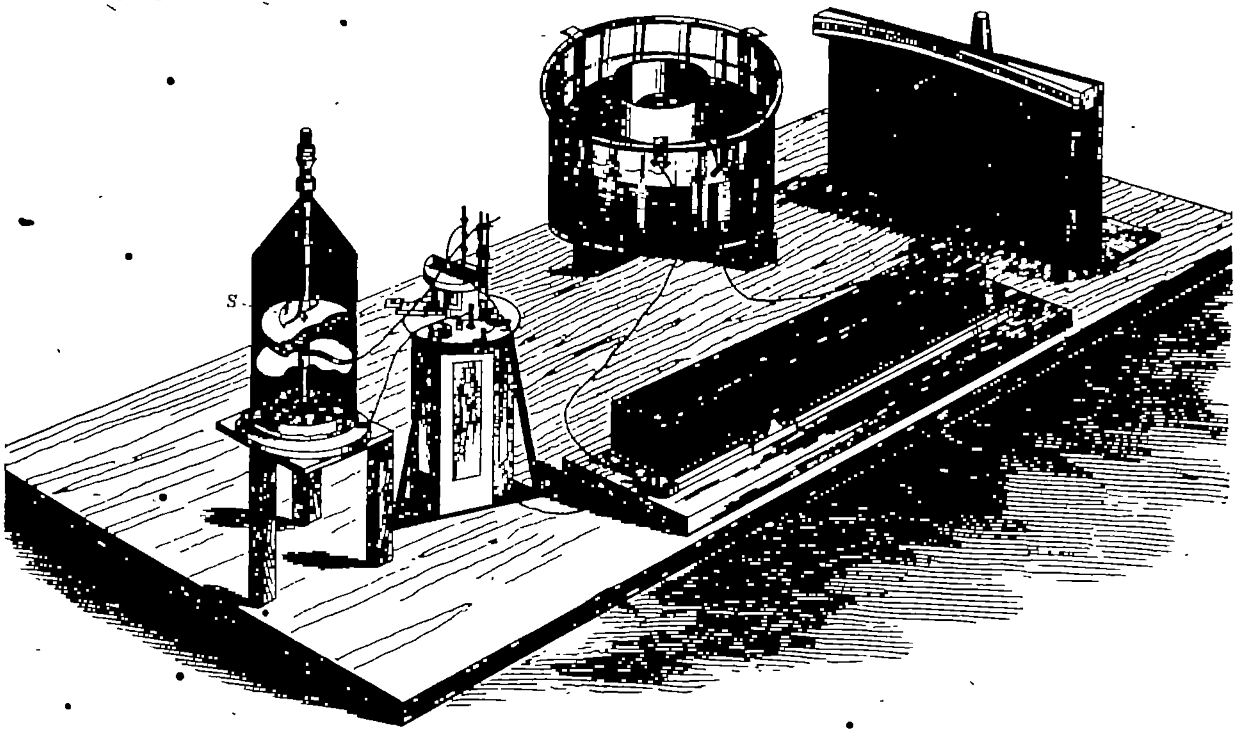
IN the *Chem. Soc. Journ.* for March Dr. Ramsay continues his investigations on atomic and molecular volumes; he adduces evidence in support of the number 7 as representing the atomic volume of nitrogen; the generally-accepted number is 2·3. He also shows that the molecular volumes of compounds of the benzene, naphthalene, and anthracene series are smaller than those calculated from the best established atomic volumes of the constituent elements, and his numbers suggest that the condensation in these compounds may very probably be proportional to the number of carbon atoms in each molecule, and also to the manner of "linking" of these atoms.

ON A METHOD OF MEASURING CONTACT ELECTRICITY[1]

IN my reprint of papers on electrostatics and magnetism (§ 400, of date January, 1862) I described briefly this method, in connection with a new physical principle, for exhibiting contact electricity by means of copper and zinc quadrants substituted for the uniform brass quadrants of my quadrant electrometer. I had used the same method, but with movable disks for the contact electricity, after the method of Volta, and my own quadrant electrometer substituted for the gold-leaf electroscope by which Volta himself obtained his electric indications, in an extensive series of experiments which I made in the years 1859–61.

I was on the point of transmitting to the Royal Society a paper which I had written describing these experiments, and which I still have in manuscript, when I found a paper by Hankel in Poggendorff's *Annalen* for January, 1862, in which results altogether in accordance with my own were given, and I withheld my paper till I might be able not merely to describe a new method, but if possible add something to the valuable information regarding properties of matter to be found in Hankel's paper. I have made many experiments from time to time since 1861 by the same method; but have obtained results merely confirmatory of what had been published by Pfaff in 1820 or 1821, showing the phenomena of contact electricity to be independent of the surrounding gas, and agreeing in the main with the numerical values of the contact differences of different metals which Hankel had published; and I have therefore hitherto published nothing except the slight statements regarding contact electricity which appear in my "Electrostatics and Magnetism." As interest has been recently revived in the subject of contact electricity, the following description of my method may possibly prove useful to experimenters. The same method has been used to very good effect, but with a Bohnenberger electroscope instead of my quadrant electrometer, in researches on contact electricity by Mr. H. Pellat, described in the *Journal de Physique* for May 1880.

The apparatus used in these experiments was designed to secure the following conditions:—To support two circular disks of metal about four inches in diameter in such a way that the opposing surfaces should be exactly parallel to each other and approximately horizontal, and that the distance between them might be varied at pleasure from a shortest distance of about one-fiftieth of an inch to about a quarter or half an inch. This part of the apparatus I have called a "Volta-condenser." The lower plate, which was the insulated one, was fixed on a glass stem rising from the centre of a cast-iron sole plate. The upper plate was suspended by a chain to the lower end of a brass rod sliding through a steadying socket in the upper part of the case. A stout brass flange fixed to the lower end of this rod bears three screws, one of which, S, is shown in the drawing, by which the upper plate can be adjusted to parallelism to the lower plate. The other apparatus used consisted of a quadrant electrometer, and in my original experiments an ordinary Daniell's cell, in my later ones a gravity Daniell's cell of the form which I described in *Proc.* R.S. 1871 (pp. 253–259) with a divider by which any integral number of per cents. from 0 to 100 of the electromotive force of the cell could be established between any two mutually insulated homogeneous metals in the apparatus.



Connections.—The insulated plate was connected by a brass wire passing through the case of the Volta-condenser to the electrode of the insulated pair of quadrants. The upper plate was connected to the metal case of the Volta-condenser and to the metal case of the electrometer, one pair of quadrants of which were also connected to the case. One of the terminals of the divider, which connected the poles of the cell, was connected to the case of the electrometer, and to the other terminal was attached one of the contact wires, which was a length of insulated copper wire having soldered to its outer end a short piece of platinum. The other contact surface was a similar short piece of platinum fixed to the insulated electrode of the electrometer. Hence it will be seen that metallic connection between the two plates was effected by putting the divider at zero and bringing into contact the two pieces of platinum wire.

Order of Experiment.—The sliding piece of the divider was put to zero, and contact made and broken and the upper plate raised: then the deflection of the spot of light was observed. These operations were repeated with the sliding piece at different numbers on the divider scale until one was found at which the make-break and separation caused no perceptible deflection. The number thus found on the divider scale was the number of per cents. which was equal to the contact electric difference of the plates in the Volta-condenser.

[*Addendum*, November 23, 1880.—Since the communication of this paper to the British Association, I have found that a dry platinum disk, kept for some time in dry hydrogen gas, and then put into its position in dry atmospheric air in the Volta-condenser, becomes positive to another platinum disk which had not been so treated, but had simply been left undisturbed in the apparatus. The positive quality thus produced by the hydrogen diminishes gradually, and becomes insensible after two or three days.]

---

[1] By Prof. Sir William Thomson, M.A., F.R.S.; being a paper read before Section A of the British Association at Swansea, 1880, with additions.

P.S.—On December 24, 1880, one of two platinum plates in the Volta-condenser was taken out; placed in dried oxygen gas for forty-five minutes; taken out, carried by hand, and replaced in the Volta-condenser at 12.30 on that day. It was then found to be negative to the platinum plate, which had been left undisturbed. The amount of the difference was about ·33 of a volt. The plates were left undisturbed for seventeen minutes in the condenser; and were then tested again, and the difference was found to have fallen to ·29 of a volt. At noon on the 25th they were again tested, and the difference found to be ·18. The differences had been tested from time to time since that day, the plates having been left in the condenser undisturbed in the intervals. The following Table shows the whole series of these results:—

Time.	Electric difference between surfaces of a platinum plate in natural condition, and a platinum plate after 45 minutes' exposure to dry oxygen gas.
Dec. 24, 12.30 p.m.	·33 of a volt.
24, 12.47 p.m.	·29 "
25, noon	·18 "
27, noon	·116 "
28, 11.20 a.m.	·097 "
31, noon	·047 "
Jan. 4, 11.0 a.m.	·042 "
11, 11.40 a.m.	·020 "

Mr. Rennie, by whom these experiments were made during the recent Christmas holidays, had previously experimented on a platinum-plate which had been made the positive pole in an electrolytic cell with an electromotive force of one volt, tending to decompose water acidulated with sulphuric acid; the other pole being a piece of platinum wire. After the plate had been one hour under this influence in the electrolytic cell he removed it, and dried it by lightly rubbing it with a piece of linen cloth. He then placed it in the Volta-condenser, and found it to be negative to a platinum plate in ordinary condition; the difference observed was ·27 of a volt. This experiment was made on October 21; and on November 8 it was found that the difference had fallen from ·27 to ·07. Mr. Rennie also made similar experiments with the platinum disk made the negative pole in an electrolytic cell, and found that this rendered the platinum positive to undisturbed platinum to a degree equal to about ·04 of a volt. The effect of soaking the platinum plate in dry hydrogen gas, alluded to in my first postscript, which also was observed by Mr. Rennie, was found to be about ·11 of a volt. Thus in the case of polarisation by hydrogen, as well as in the case of polarisation by oxygen, the effect of exposure to the dry gas was considerably greater than the effect of electro-plating the platinum with the gas by the electromotive force of one volt.

THE NAVAL ARCHITECTS

THE session of the Institution of Naval Architects just concluded was remarkable for the number of papers on the use of steel both for shipbuilding and marine engineering. This was perhaps to be expected in consequence of the commotion among steel-users caused by the total failure of the steel plates supplied for the boilers of the Russian yacht *Livadia*. Accordingly we find four papers on this subject. The first, by Mr. Samuda, deals with the effect which the introduction of steel hulls and steel-faced armour has had upon the design of ships of war. This paper is based upon the results attained by the author with a steel corvette which he has recently constructed for the Argentine Government. The dimensions of this vessel as actually constructed, and the corresponding dimensions which must of necessity have been adopted, had the material of construction been iron instead of steel, should be carefully noted in order to appreciate the true benefits to be derived from the use of the latter material.

The vessel as actually constructed is 240 feet long by 50 feet wide; the displacement is 4200 tons, the power 4500 horses, and the coal-supply 650 tons, which is sufficient to allow her to steam 6000 miles at a speed of 8 knots, or 4300 miles at a speed of 10 knots. The speed which it is expected will be attained on the measured mile is 13¾ knots. If the vessel had been built of iron and cased with iron armour, the speed and shot-resisting power remaining the same, the dimensions would have been as follows:—Length, 260 feet; breadth, 55 feet; displacement, 5200 tons; power, 5000 horses; and coal-supply, 720 tons. This example is a very good illustration of the great benefit which naval architects will derive from the use of steel, a benefit, be it remarked, which comes most opportunely in these days of powerful ordnance; for not only has the steel-faced armour about 25 per cent. more resisting power than an equal thickness of iron, but also the weight saved in the hull and machinery by the use of steel enables a greater quantity of armour to be carried.

The second paper on steel was by Mr. W. Parker, Chief Engineer Surveyor to Lloyd's Registry, "On the Causes of the Failure of the Steel Plates supplied for the Boilers of the *Livadia*." Steel, as is well known, had formerly a bad reputation for treachery and uncertainty of behaviour. Latterly however a more intimate knowledge of the methods of manufacture and a better acquaintance with the processes of working had apparently quite removed this impediment to its general introduction. The failure therefore above referred to came as a surprise to shipbuilders, and the circumstances demanded and received a most searching inquiry at the hands of the engineer officers of Lloyd's. It was found that samples cut from the broken plates fulfilled every test demanded by Lloyd's, the Admiralty, and the Board of Trade. The tensile strength proved to vary between the very narrow limits of 26·1 and 28·3 tons per square inch. The elongation after fracture of samples 8 inches in length ranged from 27·3 to 34·3 per cent. Nevertheless in spite of the apparently excellent quality of the plates, it was found that after they had been punched and worked into place they had become so brittle as to be unable to stand the hydraulic proofs to which it is usual to subject boilers, and in some instances even, the plates cracked before the hydraulic test was applied. The further investigations of Mr. Parker proved that whenever samples of the plates were punched, the material became so brittle as to break into pieces under the blow of an ordinary sledge-hammer; the tensile strength dropped to 18·4 tons per square inch, and the extensibility disappeared altogether.

Specimens were next subjected to chemical analysis, with the result of proving that, the material was from the chemical point of view far from homogeneous. A portion of the plates, about 8 inches long by 4 inches wide, was carefully freed from rust by grinding, and successive layers were planed off from one side to the other. Each layer was one-sixteenth of an inch in thickness, and they were numbered in succession as they were planed off. The result of analysis showed that the quantities of carbon, manganese, sulphur, and phosphorus varied in an extraordinary degree. These differences in the chemical composition, however, did not satisfactorily account for the behaviour of the metal. It was not till the appearance of the fractures suggested, that the material had not been properly worked under the hammer and rolls, that a really satisfactory solution of the mystery was arrived at. "A piece cut from the fractured plate was raised to a red heat and rolled to half its original thickness. Strips were then cut from this ⅜ inch plate, and punched with holes ⅜ inch diameter, being one half the size of those in the ¾-inch plate. This extra work on the material seemed to raise its ductility appreciably, the strips being found to bend well after punching, several of them bending to right angles, and only one of them breaking short off, while none of them showed such extraordinary signs of brittleness as were observable in the material when of the original thickness. Three pieces tested for tensile strength after rolling broke under a stress of 33 tons, 34·25 tons, and 32·3 tons per square inch respectively, with an elongation in 8 inches of 12 per cent., 11·25 per cent., and 17·5 per cent. respectively, the last-mentioned specimen being annealed."

Mr. Parker concludes his paper by expressing the hope that the facts which he was able to lay before the meeting will tend to allay alarm and to strengthen confidence in the use of mild steel for constructive purposes. When it is considered what an enormous quantity of this material is now being used in the construction of marine boilers, as well as for the hulls of vessels, this wish will be heartily re-echoed. In the spring of 1878 there were only two marine boilers of the modern form made of mild steel in existence. Within twelve months subsequently to that date 120 steamers had been fitted with boilers of this material, and during the same period in the following year 280 vessels more. At the present moment there are no less than 1100 steel boilers in use in steamships, weighing together over 17,000 tons.

The third paper on steel was by Mr. J. R. Ravenhill, and gave an account of the improvements which have recently been made in mild steel castings. Many portions of machinery and steam-engines which till quite recently were invariably made of cast iron can now be formed of cast steel, with the attendant advantages of gain in strength and saving in weight.

Perhaps the most interesting paper of the four was that by M. Berrier Fontaine, the eminent French naval architect, "On the Use of Mild Steel for the Construction of the Hulls of Ships in the French Navy." The French were undoubtedly the first to introduce this material into the national navy; but though their experience of it is longer than our own, they do not seem to have acquired the same confidence in its use which is now felt in this country. For instance, we are in the habit of constructing the entire hulls of ships, including the below-water plating, of steel; the French, on the other hand, continue to use iron for all work which has to be exposed to the action of sea water. The reason advanced is that they find that steel when immersed in salt water corrodes with far greater rapidity than iron. M. Berrier Fontaine quotes as examples two gunboats, the *Épée* and the *Tromblon*, the hulls of which, completely steel-plated, have both given proof of rapid and deep corrosion. "The *Tromblon* was launched at Toulon on January 20, 1875, and remained afloat till October 27 of the same year. During that period of nine months it was found necessary to dock her three times, that it is to say, about every two months to paint the hull, the plates being rapidly and deeply attacked, especially in the neighbourhood of the water-line. The progress of this corrosion went on with such unusual rapidity, that when the time came to pass the *Tromblon* into the reserve it was thought necessary to haul her on to a slip instead of keeping her afloat." The whole subject of the corrosion of steel plates is at present involved in great mystery, and no two authorities seem able to agree about the cause. In the English Admiralty it is commonly believed that it is due to the presence on the surface of the plates of portions of black oxide, which constitute with the steel so many active galvanic couples, which of course rapidly promote corrosion, and hence great care is now taken to remove all traces of this oxide before the plates are coated. Whatever may be the cause, it is perfectly certain that the experience of English builders does not tally with that of M. Berrier Fontaine in this particular. Certain cases of corrosion have no doubt occurred in this country, and the hull of the *Iris* is an example in point; but as far as present experience goes such cases are the exception instead of the rule.

M. Berrier Fontaine gives an interesting account of the tools and other plant used in the French dockyards for the working of steel. He describes also the early difficulties which the workmen experienced, all of which have been successfully overcome. As regards the process of manufacture adopted in France, it appears that equally good results are obtained from the Bessemer and the Siemens methods, so much so that when contracts are given out it is never specified that the material is to be prepared by either of the two processes. In some works the Siemens system is employed for the superior sorts of steel, and the Bessemer process reserved for inferior descriptions, such as rails, while in other works exactly the opposite takes place. In this country, on the contrary, it is almost universally the rule to specify the Siemens process for the production of mild steel plates for ship-building and for boiler purposes.

DUNES AND MOVING SANDS

IN a communication made to the Russian Society of Naturalists, M. Sokoloff has given a description of the dunes which are seen close by Sestroryetsk, at the eastern end of the Gulf of Finland. The whole of the isthmus between the Gulf and the basin of Sestroryetsk is covered with dunes which have a double origin. Those which are close by the sea-shore are old shore-ridges, mostly covered with vegetation, parallel to one another, and having each the form of a straight line, while those which are situated more east are true dunes, built up of sand driven by the wind. They have the direction north and south, and they reach the height of a hundred feet. Several of them are quite covered with pine-forests and with moss, while others are almost quite naked. The latter are constantly brought into motion by the west wind, and south of the Sestra River a high dune will shortly cover the houses of the working men of the Sestroryetsk manufactory. This dune, about 700 feet broad, has already covered several houses, and it is always advancing further, forming smaller parallel dunes fifteen feet high; its western side is covered with numerous excavations, from which the wind has taken the sand to move it further east. M. Sokoloff, while agreeing with the well-known classification of dunes established by the explorer of Sahara, M. Vatonne, thinks that the dunes of the deserts, which owe their origin to the action of wind, might be very easily distinguished from the mostly lower ridges which appear on the sea-shores under the influence of waves, these last usually having the form of straight lines, whilst the true dunes always have a semicircular form. M. Severtsoff observed after this communication that in the steppe of Kyzyl-koum, true dunes often have the same form of parallel, quite straight ridges. However, having at their origin a circular form which is so characteristic of the *barkhans* of the steppe, they lose by and by this form, and several smaller dunes, uniting together at their ends, take the form of a long straight ridge perpendicular to the prevailing direction of wind. M. Moushketoff, who has made a close acquaintance with the sands of Central Asia, observed that these sands, which are all sporadic, being spread among older formations, are very different as to their extent, their stratigraphical and petrographical characters, and their origin. They might be subdivided into three different classes:—1. Those which have a marine origin and which might be observed on the south-eastern shores of Lake Aral, and especially in the Kara-koum steppe. They are about 250 yards and 70 feet high, and mostly parallel to the shore. They are typical marine dunes, but their extension closely depends upon the extension of the Aralo-Caspian formation, the fossils of which are always found broken in these sands. 2. The fluvial dunes, which are very common in the valleys of the Amou, Syr, Sourkhan, and others; their height rarely exceeds 10 to fifteen feet, and their length is from 100 to 150 feet; their sand is steel-gray, and contains gypsum and clay. 3. The *barkhans* are sub-aerial formations; they prevail in the central part of the steppe Kyzyl-koum, but are rather rare in the Kara-koum steppe. They have the form of a sickle, and are somewhat conical, their maximum height being as much as 20 to 30 feet; their slopes are very different, that which is under the influence of the wind having an inclination from 5 to 13 degrees, whilst the other slope is short and steep, the inclination reaching sometimes as much as 43 degrees; they consist of a dirty-yellow or red sand, owing to their origin in the Tertiary sandstone, or sometimes in other harder rocks, as for instance, in the valley of the Ili River. Sometimes typical *barkhans* are met with among dunes, being a secondary formation arising out of the marine dunes. As to the plantations of trees on dunes, M. Moushketoff thinks that it would be far more rational first to determine whence the sand is brought by the wind, and to make the plantations of trees or bushes, according to the chemical character of the sand on this place, instead of making them on the dunes themselves.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

MANCHESTER.—We learn that the Council of the Owens College proposes shortly to establish an independent Chair of Applied Mathematics.

EDINBURGH.—The tercentenary of the University of Edinburgh will be celebrated in 1883. The senatus are to invite representatives from other universities to be present; they also propose to bring out a history of the University during the first 300 years.

THE winter session of the College of Agriculture, Downton, Salisbury, was brought to a close on Wednesday, when the prizes were presented by Earl Nelson, who dwelt at considerable length on the present state and future prospects of British agriculture, taking a very hopeful view of the latter. The High Sheriff of Wilts warmly advocated such a combination of science with practice as was in vogue at the College. The Scholarship offered for competition amongst students who have completed their first year at the College was awarded to Mr. Louis Johnstone, son of Sir Harcourt Johnstone, Bart., Hockurss Hall, Scarborough, the Hon. Victor A. N. Hood *proxime accessit*.

SOCIETIES AND ACADEMIES

LONDON

Royal Society, March 31.—"Permanent Molecular Torsion of Conducting Wires produced by the Passage of an Electric Current," by Prof. D. E. Hughes, F.R.S.

In a paper on "Molecular Electro-Magnetic Induction," presented to the Royal Society (March 7, 1881, I gave a description of the induction currents produced by the torsion of an iron wire, and the method by which they are rendered evident. The electro-magnetic induction-balance there described is so remarkably sensitive to the slightest internal strain in anywise submitted to it, that I at once perceived that the instrument could not only determine any mechanical strain such as torsion or longitudinal stress, but that it might indicate the nature and cause of internal strains. Upon putting the question to it, Does the passage of electricity through a wire produce a change in its structure? the answer came, It does, and that to a very considerable extent; for an iron wire adjusted to perfect zero, and which would remain free from any strain for days, becomes instantaneously changed by the first passage of a current from a single cell of a Daniell's battery; the wire has now a permanent twist in a direction coinciding with that of the current, which can be brought again to zero by mechanically untwisting the wire, or undoing that which the passage of electricity has caused. Before describing the new phenomenon, I will state that the only modification required in the apparatus is a switch or key by means of which the telephone upon the wire circuit is thrown out of this circuit, and the current from a separate battery of two bichromate cells passed through the wire alone, at the same time, care being taken that no current passes through the coil, but that its circuit should remain open during the passage of the electric current through the wire under observation; an extra switch on this circuit provides for this. The reason for not allowing two currents to react upon each other, is to avoid errors of observation which may be due to this cause alone. When, however, we take an observation, the battery is upon the coil and the telephone upon the wire alone. An experiment thus consists of two operations. First all external communications interrupted, and an electric current passed through the wire; and, second, the electric current taken off the wire, and all ordinary communications restored. As this is done rapidly by means of the switches, very quick observations can be made, or if desired the effects of both currents can be observed at the same instant.

Now if I place upon the stress bridge a soft-iron wire ½ millim. diameter, 25 centims. long, I find, if no previous strain existed in the wire, a perfect zero, and I can make it so either by turning it slightly backwards or forwards, or by heating the wire to a red heat. If I now give a torsion of this wire, I find that its maximum value is with 40° torsion, and that this torsion represents or produces electric currents whose value in sonometric degrees is 50; each degree of torsion up to 40 produces a regular increase, so that once knowing the value of any wire, we can predict from any sonometric readings the value in torsion, or the amount of torsion in the opposite direction it would require to produce a perfect zero.

If now I place this wire at zero, and thus knowing that it is entirely free from strain I pass an electric current through it, I find that this wire is no longer free from strain, that it now gives out induction currents of the value of 40, and although there is no longer any battery current passing through this wire that the strain is permanent, the outside coil neither increasing nor diminishing the internal strain it has received by the passage of an electric current through the wire; upon giving a torsion to the wire in one direction, I find the inductive force increase from 40 to 90, but in the other direction it is brought to zero, and the amount of torsion, some 35°, required to bring the wire again to zero represents exactly the twist or strain that had been produced instantaneously by the passage of an electric current. If I repeat the experiment, but reverse the battery current sent through the wire, I find an opposite twist of exactly the same value as previously, and that it now requires an opposite torsion to again bring the wire to zero. It is not necessary however to put on an equal opposite torsion on wire to bring the currents to zero, for as I have shown in my late paper, the sonometer not only allows us to measure the force and indicate its direction, but allows us to oppose an equal electric current of opposite name, thus producing an electrical zero in place of the mechanical one produced by torsion.

Evidently here there has been a sudden change in the structure of the wire, and it is a twist which we can both measure and reproduce. The question at once becomes, Has a molar twist been given to the wire such as would be detected by the arm or free end of the wire, or a molecular change leaving no trace upon its external form of what has passed?

It will be found that, notwithstanding that it requires some 40° of torsion to annul the effects of a passage of an electric current, no visible movement nor any tendency of the free end to turn in the direction of the twist it has received can be observed. I believe however to have noticed a slight tremor or movement of half a degree, but as I could not always reproduce it, and as it is so slight compared with the 40° of internal twist, I have not taken it into account, for if the wire is firmly fastened at both ends no molar torsion being possible, except an elastic one, which would instantly spring back to zero, the current on passing produces its full effects of twist and it is permanent. Thus the molecules have in some extraordinary way rearranged themselves into a permanent twist, without the slightest external indication of so great a change having taken place. An equally remarkable change takes place in aid of, or against (according to direction of current) an elastic permanent strain. Thus, if I first put the wire under 40° right-handed permanent torsion, I find its value to be 50. Now, passing the positive of battery through its free end, and negative to fixed end, the induction currents rise at once in value to 90; if, now, the negative is momentarily passed through the free end and positive to fixed end the induced currents at once fall to 10, and these effects remain, for on taking off the elastic torsion the wire no longer comes to zero, but has the full twist value produced by the current.

Tempered steel gave only one or two degrees against fifty for soft iron, but supposing this might be due to its molecular rigidity, I carefully brought the wire to zero, and then observed the first contact only. I found then that the first contact gave a value of 40, but the second and following only one or two. By bringing the wire back to zero by a momentary touch with a magnet a continued force of 40, or if constant reversals were used instead of a simple contact, there was constant proof of a similar great molecular change by the passage of a current in steel as well as iron.

I can find no trace of the reaction of the wire upon the magnetism of the earth, as in all positions the same degree of force was obtained, if great care is taken that the wire is absolutely free from longitudinal magnetism; there is however a slight reaction upon its own return wire if brought within 1 centim. distance of the wire, and this reduces the twist some 10°. The maximum effects are obtained when the return wire is not nearer than 25 centims.; thus the action is not one produced by a reaction, but by direct action upon its internal structure.

Copper and silver wires so far show no trace of the action. I believe, however, that a similar strain takes place in all conductors, and I have obtained indirectly indications of this fact; in order, however, to verify this, would require a different method of observation from the one I have described, and I have not yet perfected the apparatus required.

It seemed probable that if I approached a strong permanent magnet to the wire, I should perceive a twist similar to that produced by the passage of a current; but no such effects were observed. But it has a most remarkable effect of instantly bringing to zero a strain produced by the current, and, no matter which pole, the effect was the same. Thus, a strain of 50°, which remains a constant, instantly disappears upon the production of longitudinal magnetism, and I have found this method of reducing an iron wire to zero of strain far more effective than any other method yet tried, such as vibrations, heat, twisting, &c.

It will be seen from this that the molecular arrangement set up by magnetism is very different from that produced by the passage of an electric current. It evidently has a structure of its own, else it would not have instantly destroyed the spiral strain left by the passage of electricity if it had not taken up a new form, as rendered evident in the longitudinal magnetism, which we could at once perceive on the wire. This question, however, belongs to a separate investigation, and I hope the apparatus will aid me later in throwing some new light upon this subject.

Another method of reducing the wire to zero, after the passage of a current, is to keep the wire in a constant state of vibration. It requires in time about one minute to bring it to zero, but if, on the contrary, I set the wire vibrating during the passage of the current, the permanent twist becomes greater and more difficult to reduce to zero.

If a wire which has internal strains is heated to redness, these strains almost entirely disappear, and I can thus reduce by heat a strain which a current had produced, but heat, whilst allowing of greater freedom and motion of its molecules, does not prevent an internal strain being set up, for whilst heat can reduce the wire to zero, after the passage of the current, the effects are increased. If, during the time that the wire is at a red heat, the current is passed in the same time, and at the same instant we take off the current and the external heat, the wire when cold *will* be found to have a higher degree of strain than previously possible with the wire when cold.

We have seen that both mechanical vibrations and heat can reduce the wire to a zero, but its action is very slow, several minutes being required; but the action of electricity in producing a permanent twist is exceedingly quick. I have found that a single contact, whose duration was not more than 0·01 of a second, was equal to that of a prolonged contact of several minutes, and magnetism was equally as quick in reducing this strain to zero. And it is the more remarkable when we consider the very great mechanical force required by torsion of the wire to untwist the strain produced in an instant of time by electricity.

The results I have given are those obtained upon soft iron wires of ½ millim., but I have experimented with different sizes up to 3 millims. diameter. The results with 1 millim. diameter were quite as evident as the ½ millim., but on the 3 millim. wire the strain was reduced to 25° instead of 50°, owing to the extreme rapidity and low electrical resistance compared with my small battery wires. On a telegraph line, the wire of which is almost entirely of iron, there must be a very great strain set up, which however would remain a constant, except where reversed currents are used, and in this case a constant movement of the molecules of the wire must be the result.

I believe it to be most important that we should determine, as far as we can by experimental research, the nature of all molecular changes produced by electricity and magnetism, and in this belief I am happy in being able to bring this paper before the Royal Society.

Chemical Society, April 7.—Dr. Russell in the chair.—The following papers were read:—On the organic matter in sea-water, by W. Jago. The author concludes that the organic matter of sea-water is much more capable of resisting oxidising agents than that present in ordinary fresh water, and that it is probably organised and alive.—On the action of compounds inimical to bacterial life, by W. M. Hamlet. The cultivating fluids used comprised Pasteur's fluid, beef tea, hay infusion, urine, brewer's wort, and extract of meat; these were sterilised by boiling for ten minutes in Pasteur's flask, cooled with suitable precautions, and then seeded with hay solution, and the substance under examination added. Many gases, &c., were tried. Chlorine and hydric peroxide were fatal to bacteria, while chloroform, creosote, carbolic acid, salicylic acid, &c., hindered their development, but did not destroy them.

Anthropological Institute, March 22.—F. W. Rudler, F.G.S., vice-president, in the chair.—The election of George B. Waterhouse was announced.—Mr. R. W. Felkin exhibited a series of photographs of scenes and natives of Central Africa, taken by Herr Buchta.—Prof. Flower, F.R.S., exhibited a collection of crania from the Island of Mallicollo in the New Hebrides, which had been lately presented to the Museum of the Royal College of Surgeons by Mr. Luther Holden. The peculiar conformation of the heads of the people of this island attracted the attention of Capt. Cook and the naturalist Forster, who accompanied the great navigator on his second voyage, and who writes that "the depressed and backward inclining forehead causes an appearance in the looks and countenances of the natives similar to those of monkeys." Yet Cook bears testimony to the activity, intelligence, and honesty of this "ape-like nation," as he calls them. A few years ago Mr. Busk described some skulls collected in the island by the late Commodore Goodenough, and found that they all showed signs of having undergone alterations in form from pressure applied in infancy. The present collection corroborates Mr. Busk's views; some of the skulls being deformed to a remarkable degree, and closely resembling the well-known Peruvian crania from the neighbourhood of Lake Titicaca. This is the more remarkable, as on no other of the numerous islands of the neighbouring ocean is the practice known to exist. Besides the deformed crania the collection contained several monumental heads, said to be those of chiefs. In these the features are modelled in clay upon the skull, apparently with the intention of preserving a likeness of the dead person; the face is painted over with red ochre, artificial eyes introduced, and the hair elaborately dressed and ornamented with feathers. In one case the hair had been entirely removed, and a very neatly-made wig substituted. The head thus prepared is stuck upon a rudely-made figure of split bamboo and clay, and set up in the village temple, with the weapons and small personal effects of the deceased. This is a custom not hitherto known to exist among the Mallicollese, and its motive is not completely understood, but it is obviously analogous to many others which have prevailed throughout all historical times and in many nations, manifesting itself, among other forms, in the mummified bodies of the Ancient Egyptians and the marble busts over the mouldering bones in Westminster Abbey.—Mr. Joseph Lucas read a paper on the ethnological bearings of the terms Gipsy, Zingaro, Rom, &c.

Zoological Society, April 5.—Prof. W. H. Flower, LL.D., F.R.S., president, in the chair.—Mr. Sclater exhibited five bird's skins obtained by the Rev. G. Brown, C.M.Z.S., on the Island of Rotumeh, and presented by him to the *Challenger* Expedition. Mr. Sclater also exhibited specimens of two new species of birds from New Britain, belonging to the Museum Godeffroi, which he proposed to call *Trichoglossus rufigularis* and *Ortygocichla rubiginosa*.—Mr. H. E. Dresser exhibited and made remarks on a specimen of *Saxicola deserti* killed in Scotland, and a specimen of *Picus pubescens* believed to have been killed in Normandy.—Mr. W. A. Forbes, F.Z.S., read some notes on the external characters and anatomy of the Californian Sea Lion (*Otaria gillespii*), and exhibited some coloured drawings of this animal.—Prof. Flower, F.R.S., read a note upon the habits of the Manatee, chiefly in reference to the question as to whether this animal had the power of voluntarily leaving the water for the purpose of feeding on the herbage of the banks, as stated by many authors, and as supported by a communication from the late Mr. R. B. Dobree, notwithstanding which Prof. Flower considered the evidence upon which the statement was based to be very unsatisfactory.—A paper was read upon the same animal by Miss Agnes Crane, consisting of observations upon the Manatees lately living in the Brighton Aquarium.—Dr. A. Günther, F.R.S., read an account of the Amphisbænians and Ophidians collected by Prof. Bayley Balfour in the Island of Socotra. A new form of snakes allied to *Tachymenis* was named *Ditypophis vivax*, a new species of *Zamenis* was named *Z. Socotræ*, and a new form of Amphisbænian *Pachycalamus brevis*.—Mr. W. T. Blanford, F.R.S., gave an account of six species of lizards which had been collected by Prof. Bayley Balfour in Socotra; of these the three following appeared to be undescribed:—*Hemidactylus homœolepis*, *Pristurus insignis*, and *Eremias Balfouri*.—Mr. Charles O. Waterhouse read a paper on the coleopterous insects which had been collected by Prof. Bayley Balfour in Socotra. The number of species of which examples were collected was twenty-four, and showed that the fauna of Socotra, judging from this collection, was distinctly African. Twelve of the species appeared to be new.—A communication was read from Prof. J. O. Westwood containing observations on two species of Indian butterflies, *Papilio castor* and *P. pollux*.—A communication was read from Mr. Edgar A. Smith, containing some observations on the shells belonging to the genus *Gouldia* of C. B. Adams.—Mr. Sclater read the fifth of his series of notes on the birds of the vicinity of Lima, Peru, with remarks on their habits by Prof. Nation, C.M.Z.S. A new species of *Buarremon*, of which an example was in the collection, was proposed to be dedicated to its discoverer as *B. Nationi*.—Mr. G. E. Dobson read some notes on certain points in the muscular anatomy of the Green Monkey, *Cercopithecus callithrix*.

Edinburgh

Royal Society, March 21.—Sir Wyville Thomson, vice-president, in the chair.—Prof. Geikie communicated a paper by Mr. C. A. Stevenson, B.Sc., on the earthquake of November 28, 1880, in Scotland and Ireland. The main conclusions at which the author arrived were the following:—The centre of the disturbance was at a point some thirteen miles south-west of Fladda, in the continuation of the line of the fault that lies along the great glen which stretches in a south-westerly direction from Inverness. The disturbance was felt over an area of 19,000 square miles, extending as far east as Blair Athole, as far north as the Butt of Lewis, and as far south as Armagh in Ireland. The undulation was everywhere of an up-and-down character; its breadth was estimated at 1100 feet, and its velocity seemed to vary from 3·75 to 7·75 miles per minute, having a mean value of 6·75 over the sea and 4·68 over the land. The accompanying rumbling was not heard at all the stations, and appeared to have been best heard where but little soil covered the hard dense substratum of rock. The disturbance was felt better over the older rocks. Noises were not heard outside a radius of 38 miles from the centre, except in the north of Ireland, where however it was suggested that the noise was due to the indirect action of the earthquake in causing a secondary local disturbance.—Mr. P. Geddes read his first communication on the classification of statistics. After pointing out the utter confusion that exists in many of the national classifications of the present time, the author criticised the arrangements suggested by Deloche and Mouat, which were equally unsatisfactory, because of their unscientific and artificial methods. Any classification, to be natural, must be based upon some broad principle common to all kinds of communities or societies. A fundamental meaning must therefore be attached to the word society—a definition given to it that will include societies of all kinds of organisms. Such a definition must obviously take account of the vital functions of organisms in relation to the matter and energy of the universe. We have thus matter and energy on the one hand, organisms on the other. Mr. Geddes, confining himself meanwhile to the first of these two great divisions, proceeded to classify the sources of energy, adopting the classification given by Prof. Tait in his Thermodynamics, and showing how naturally such things as food, fuel, machines, &c., fell into their places in such an arrangement. He then considered the classification of sources of matter used for other than energy-properties, taking for this purpose the well-known three-fold division into minerals, vegetables, and animals. The development of ultimate products through their successive phases of raw material, manufacture, exportation, trade, &c., and the classification of all products under the three chief headings of potential, mediate, and ultimate, completed the one aspect of the statistical method in so far as it related to the matter and energy of the universe. It still remained however to take account of the loss, or more properly the degradation or dissipation, suffered. The classification must indicate not only the kind of loss, *e.g.* whether in raw material, in manufacture, in trade, in ultimate product, or in remedial effort, but also the agency that was the direct cause of the loss, whether physical, as earthquake, flood, storm, &c.; or biological, as insects, fungi, &c.; or social, as crime, war, or folly.—Mr. T. Muir communicated three mathematical notes: on Prof. Cayley's theorem regarding a bordered skew determinant; on the law of extensible minors in determinants; and on a problem of arrangement.—Mr. J. Y. Buchanan read a short paper on the oxidation of ferrous salts.—Prof. Tait made a brief communication on some space loci.

PARIS

Academy of Sciences, April 4.—M. Wurtz in the chair.—M. de Quatrefages presented an example of the Edwards Medal.—The following papers were read:—On micrometric measurements during the transit of Venus of 8 December, 1874, by M. Puiseux. These measurements (393 in number and in five categories) at St. Paul and Pekin fairly agree, though the conditions were unfavourable, and give for the parallax 9"·05.—On the same subject, by M. Mouchez. He considers the method is to be strongly recommended for 1882.—Note on the methods of Wronski, by M. Villarceau.—On photographic photometry and its application to study of the comparative radiating powers of the sun and of stars, by M. Janssen. A shutter with triangular aperture is made to pass with uniform motion of known rate before a sensitised plate; this gives (with light) a series of shades on the plate, decreasing from the base side to the apex side. To compare the sensibility of two plates, differently prepared, or the photogenic intensity of two sources (using two like plates) the points of equal shade on the plates are noted. (The photographic intensity does not increase as rapidly as the luminous intensity.) For the sun he finds the time of action (with gelatine bromide of silver plates) must be reduced to $\frac{1}{2000}$ sec. to give the most rapid variation in the opacity. The sides of the slit are curved (for a special reason). A series of circular images of stars are obtained by putting the plate a little out of focus.—On alcoholate of chloral, by M. Berthelot.—On lightning flashes without thunder, by M. d'Abbadie. He observed such quite near, in a fog, when in Ethiopia.—On the combinations of phtalic anhydride with hydrocarbons of the benzene series, by MM. Friedel and Crafts.—Note on chalcomenite, a new mineral species (selenite of copper), by MM. des Cloizeaux and Damour. This is from near Mendoza in the Argentine Republic.—Researches on changes of state near the critical point of temperature, by MM. Cailletet and Hautefeuille. By colouring carbonic acid the liquid is rendered always visible. It is found that Andrews's undulatory striæ dissolve blue oil of galbanum, so that they are produced by streaks of liquefied carbonic acid. Neither in disappearance of a meniscus through compression, nor in change of state at the critical temperature does matter pass by insensible degrees from the liquid to the gaseous state.—Magnetic anomaly of meteoric iron of Santa Catharina, by Prof. Lawrence Smith. Small fragments are very feebly affected by a magnet till they have been flattened on a steel surface with a steel hammer, or heated red hot.—Attenuation of effects of virulent inoculations by use of small quantities of virus, by M. Chauveau.—M. Jordan was elected Member in Geometry in room of the late M. Chasles.—On the winter egg of phylloxera, by M. Lichtenstein.—Researches on the causes which enable the vine to resist phylloxera in sandy soils, by M. Saint-André. Weak capillary capacity of a soil seems to be the direct or indirect cause of the resistance of vines.—On the bismuthine produced by coal-mines on fire, by M. Mayençon.—On functions proceeding from Gauss's equation, by M. Halphen.—On a new application and some important properties of Fuchsian functions, by M. Poincaré.—On the relations between solar spots and magnetic variations, by M. Wolf. Tables for 1880 are given. The solar curve is also shown to be quickly rising again; a maximum may be expected in 1882 to 1883. The increase of magnetic declination for 1879–80 is 1'·18 by formula, 0'·99 by observation.—On the viscosity of gases, by Mr. Crookes.—Luminous intensity of radiations emitted by incandescent platinum, by M. Violle. From observations ranging from 775° to 1775° he constructs a formula.—On the change of volume accompanying the galvanic deposit of a metal, by M. Bouty. It is always possible in electrolysis of the same salt to diminish the intensity of current below a certain limit such that the compression produced by the deposit is then changed into attraction (the metal dilating instead of contracting in solidifying).—On the voltaic conductivity of heated gases, by M. Blondlot. He describes an experiment made by way of putting the conductivity of gases beyond doubt, and in which all parts of the apparatus are constantly open to inspection.—On the internal discharges of electric condensers, by M. Villari. The laws of the phenomenon are enunciated.—On magical mirrors, by M. Laurent. A common silvered mirror of any thickness may be rendered magical by means of heat; *e.g.* applying the end of a heated brass tube to it. The section of the tube is imaged.—On hydrosulphite of soda, by M. Schutzenberger.—On some new processes of desulphuration of alkaline solutions, by M. Scheurer-Kestner.—On application of the crystals of lead chambers, by M. Sulliot. For disinfection of rooms he places in them porous vessels containing nitrous sulphuric acid, and to attenuate the irritating action of the vapours the vessel is placed in another containing ethylic alcohol. In another case odorous gases are drawn through a column of coke moistened with nitrous sulphuric acid.—On secondary and tertiary amylamines from the active amylic alcohol of fermentation, by Mr. Plimpton.—Action of perchloride of phosphorus on isobutylic aldehyde, by M. Œconomidès.—Preparation of isobutylic acetal, by the same.—On the products of distillation of colophony, by M. Renard.—Artificial reproduction of diabases, dolerites, and meteorites of ophitic structure, by MM. Fouqué and Levy.—On the Devonian formation of Diou (Allier) and Gilly (Saône-et-Loire), by M. Jullien.

SIR WILLIAM HERSCHEL[1]

III.

IN the concluding chapter of his Memoir Prof. Holden presents a Review of the scientific labours of William Herschel designed to enable the general reader to follow the course of his work and discoveries, astronomical and physical, referring to the *Analyse de la Vie et des Travaux de Sir William Herschel*, published by Arago in 1842 for a more detailed and precise account suited to the professional astronomer; also to "A Subject-Index and a Synopsis of the Scientific Writings of Sir William Herschel," prepared by himself and Dr. Hastings, and forming one of the publications of the Smithsonian Institution.

Prof. Holden naturally commences his review with the improvements in optical instruments and apparatus effected by Herschel. Up to his time the principal aids to observation were the Newtonian telescopes of Short and the small achromatics of Dollond, the six-foot Newtonians of the former maker, aperture 9·4 inches, and the forty-six-inch achromatics of Dollond, aperture 3·6 inches, were much esteemed, and one of each class was in use at the Royal Observatory, Greenwich, in 1765. Herschel gives us some account of the progress of his manufacture of telescopes in his description of the forty-feet reflector presented to the Royal Society in 1795. When he resided at Bath, he tells us, he had long been acquainted with the theory of optics and mechanics, and wanted only that experience so essential in the practice of these sciences. This he gradually acquired by way of amusement in his leisure hours (we have seen that he was closely occupied in his profession as a teacher of music), and thus he made "several two-foot, five-foot, seven-foot, ten-foot, and twenty-foot Newtonian telescopes, besides others, of the Gregorian form of eight, twelve, and eighteen inches, and two, three, five, and ten feet focal length," in all, as already stated, he made not less than 200 seven-feet, 100 ten-feet, and about 80 twenty-feet mirrors, in addition to the Gregorian telescopes. The number of stands he invented for these instruments he states it would not be easy to assign. Proceeding further, as early as 1781 he had designed and commenced the construction of what he terms "a 30-feet aërial reflector," and invented and executed a stand for it; he cast the mirror, "which was moulded up so as to come out 36 inches in diameter," but "the composition of the metal being a little too brittle, it cracked in the cooling." It was cast a second time, but here the furnace gave way and the metal ran into the fire. These accidents and the discovery of Uranus, which introduced Herschel to the patronage of the king, put a temporary stop to the construction of a great telescope. In 1783 he finished "a very good twenty-feet reflector with a large aperture," and after two years observation with it, became so convinced of the advantages of such apertures, that he recurred to his previous intention of increasing them still further. Soon afterwards, by the representations of Sir Joseph Banks, president of the Royal Society, Herschel, as his sister relates, obtained "the promise that 2000*l.* would be granted for enabling him to make himself an instrument."

The forty-feet reflector, the *chef d'œuvre* of Herschel's optical and mechanical efforts, was commenced about the latter end of 1785, and, as Prof. Holden remarks, the history of the instrument extends from this date until the year 1811. The work was carried on assiduously with no further interruption than was occasioned by the removal from Clay Hall to Slough, where, soon after arrival, Herschel began to lay the foundation of the whole structure, and the highly-polished speculum was put into the tube, and the first view through it was obtained on February 19, 1787. But he dates the completion of the instrument from a much later period, for the first speculum came out thinner than was intended, and from its weakness did not permit of a good figure being given to it; a second mirror, cast in January, 1788, cracked in cooling; but in the next month it was re-cast and proved of the proper degree of strength. In October following a pretty good figure and polish had been assured; and Herschel says he observed the planet Saturn with it; he continued to work upon it till August 27, 1789, when upon trial on the fixed stars it gave a pretty sharp image, and on the following night he records, "Having brought the telescope to the parallel of Saturn, I discovered a *sixth* satellite of that planet, and also saw the spots upon Saturn, better than I had ever seen them before, so that I may date the finishing of the forty-feet telescope from that time." The diameter of the polished surface of the great mirror was 48 inches. In proof of the efficiency of the mechanism for giving horizontal and vertical motions to so large an instrument he mentions that in the year 1789 he had many times taken up Saturn two or three hours before meridian passage and kept the planet in view with the greatest facility till two or three hours after the passage. On the 17th of September a *seventh* satellite of Saturn, the minute object now called *Mimas*, was discovered with the forty-feet telescope, and though the instrument was used for various purposes till 1811, these discoveries of satellites constitute its most prominent additions to our knowledge. Sir John Herschel has stated that the entire cost of construction, including the apparatus for casting, grinding, and figuring the mirrors, of which two were constructed, amounted to 4000*l.*, which sum was provided by King George III. His father observed the great nebula of Orion with the forty-feet telescope on January 19, 1811, and this was one of his latest observations. In 1839 the wood-work had so far decayed as to be dangerous, and Sir John Herschel pulled it down, but piers were erected upon which the tube was placed. Writing in March, 1847, he remarks that it was so well preserved that "although not more than one-twentieth of an inch thick, when in the horizontal position it sustained within it all my family, and continues to sustain inclosed within it, to this day, not only the heavier of the two reflectors, but also all the more important portions of the machinery."

As Prof. Holden remarks, and a similar opinion has been expressed previously, it is probable that the general public expected more from the forty-feet telescope than it actually performed; but Herschel gave valid reasons why he did not make more extended use of the instrument: the time required to get it into proper working order and the number of assistants necessary were impediments in the way of its being utilised for regular observation, and he assures us he "made it a rule never to employ a larger telescope when a smaller will answer the purpose." It is certain that the mirror which was in the tube in October, 1789, the month following that in which Herschel dates the completion of the telescope, was of excellent definition. On the 16th of that month he followed the sixth and seventh satellites (*Enceladus* and *Mimas*) up to the limb of the planet, and witnessed their occultation. Holden writes: "I have never seen so good definition, telescopic and atmospheric, as he must have had on these occasions."

---

[1] Continued from p. 455.

Between the years 1796 and 1799 Herschel made an elaborate classification of stars visible to the naked eye according to their comparative brightness, which he communicated to the Royal Society in four papers published in the *Phil. Trans.* It formed the first general catalogue of the kind, exhibiting the exact state of the sky in his time. A reduction of Herschel's observations was undertaken by Mr. C. S. Peirce, and the results appear in vol. ix. of the *Annals* of the Observatory of Harvard College. So far as we know, their reduction had not been previously attempted. Instances of variability in the light of naked-eye stars were detected during the progress of the classification, the most notable discovery in this direction being perhaps that of the periodical fluctuations of α Herculis, in about sixty days. Another star in the same constellation he considered had totally disappeared in 1791, though he had seen it distinctly in 1781 and 1782.

Herschel was led to his numerous discoveries of double stars by his expectation of being able to determine the parallaxes of stars from measures made at opposite seasons of the year of the distances of pairs which appeared near together, and in the search for such pairs, his first catalogue of upwards of 200 double stars was formed and presented to the Royal Society in 1782. Long had previously measured stars upon a similar plan without success, but Herschel pointed out that his stars were not well chosen.

For the successful application of the method it is necessary that one of the pair of stars should really be situated at a much greater distance from us than the other, and as the most reasonable test of distance, Herschel assumed their difference of brightness, so that he sought for pairs where the components differed widely in this respect. The view therefore which he adopted at this time with respect to two stars seen in close proximity to each other was that one was in nearly the same line of sight as the other, but might be far more distant, thus constituting together what we now term an *optical* double star. From this beginning he was led to the discovery of revolving double stars, stars changing their relative position from year to year; and in 1803 he communicated to the Royal Society his memorable paper: "An account of the changes which have happened during the last twenty-five years in the relative situation of double stars, with an investigation of the cause to which they are owing." He was then satisfied that there were in the heavens pairs of stars which were physically connected with each other. The research for stellar parallax was not successful, but in place of it he discovered the existence of binary systems. He could not in his day decide whether the motions of suns round suns was obedient to the laws of gravitation, but five years after his death the French astronomer Savary proved that one of these revolving double stars, discovered by Herschel, ξ in Ursa Major, really was subservient to that law, and as every student of astronomy will be aware, the number of physically connected systems where the elements of the orbits have been determined, is now a large one, and is gradually increasing.

Following at present the order in which Prof. Holden refers to the scientific labours of Herschel, we now arrive at his researches on planets and satellites, respecting which the improvements he made in the construction of telescopes enabled him to advance knowledge so greatly. He was not particularly occupied with the inferior planets, but he determined the time of axial rotation of Mars with greater precision than before, and also the position of his axis. The times of the rotation of the satellites of Jupiter were found from observations on their changeable brightness, and Herschel also remarked the as yet imperfectly explained phenomena attending the transits of the satellites across the disk of the planet. Saturn, as Holden remarks, was the object of his constant attention: in addition to the discovery of the interior satellites *Enceladus* and *Mimas*, he left upon record an extensive series of observations of the seven attendants upon Saturn at that time known, and determined the time of rotation of the outer satellite *Japetus* upon its axis, by similar observations to those made upon the satellites of Jupiter. He ascertained the time of axial rotation of Saturn, and was the first who had succeeded in effecting this in a reliable manner. He also remarked the curious square-shouldered appearance which the globe of the planet has been suspected to present, and of which we still occasionally hear, though it was long ago proved by Bessel to be an illusion. It is remarkable that notwithstanding Herschel's frequent scrutiny of the planet, with all his experience of observation and the advantages of optical means surpassing by far those of his contemporaries, he does not appear to have at any time suspected the existence of the interior obscure ring. He proved beyond doubt that *Uranus* was attended by two satellites, and believed he had observed four others, and for a long time on his authority the planet was credited with six attendants.

In 1795 Herschel communicated to the Royal Society a memoir upon the nature and construction of the sun and fixed stars. As to the former he adopted a modified view of the theory which had been advanced by his friend Wilson of Glasgow; he regarded the sun as consisting of three essentially different parts: a solid and non-luminous nucleus, cool and perhaps capable of habitation, above it the atmosphere proper, and still higher the clouds or bodies which cause the sun's intense brilliancy. In this paper occurs a remark which, as Prof. Holden observes, has often been brought to bear, in consideration of the causes which maintain the solar light and heat. "Perhaps," he says, "the many telescopic comets may restore to the sun what is lost by the emission of light." We know that however credible in his day points in his theory have given way under our greatly advanced knowledge.

One of the discoveries, or perhaps we should rather say demonstrations, which especially mark his powers of research and reasoning, was that of the motion of the sun and solar system in space and the direction of this translation, which, considered generally, has received confirmation from more recent and refined investigation. Maskelyne had determined the proper motions of a limited number of the brighter stars, and Lambert, Mayer, and Bradley had thrown out ideas upon the subject, and, following up their suggestions, he showed that the sun was really in motion towards a point in the constellation Hercules, and assigned "the apex of solar motion" with what Holden considers an astonishing degree of accuracy. His second paper on this subject (1805) his biographer views as "the best example that can possibly be given of his marvellous skill in reaching the heart of a matter, and it may be the one in which his philosophical powers appear in their highest exercise."

To gain a knowledge of the "Construction of the Heavens," as Herschel termed it, of the laws of distribution of the stars generally, the star-clusters and nebulæ in space, was confessedly a main object of his astronomical labours, and the memoirs bearing upon this subject extend over the whole period of his scientific career. For this purpose he adopted a system of *star-gauging*, which in practice consisted in pointing his 20-feet reflector towards various parts of the sky and counting the number of stars in a field of view 15′ in diameter. In this way, by methodical observation, the great differences in number of the stars in certain portions of the sky over those in other directions were reliably defined, and in extreme cases the difference was very marked, as in one mentioned by Holden, where in R.A. 19h. 41m., N.P.D. 74° 33′, in the constellation Sagitta, the number of stars per field was found to be 588, while in R.A. 16h. 10m., N.P.D. 113° 4′ in Scorpio it was only 1·1—"*ein Loch im Himmel!*" In this part of his review the author briefly touches upon the views entertained by Herschel at various periods between 1784 and 1817; he considers that while at the commencement of his researches the whole subject was in utter confusion, as they progressed data for the solution of some of the most important questions were accumulated, and the results of Herschel's whole labours form the groundwork upon which future investigators must build. "He is the founder of a new branch of astronomy."

The researches for a scale of celestial measures, on light and heat, &c., on the dimensions of the stars, on the variable emission of light and heat from the sun, are briefly referred to. Herschel's observations on the spectra of the fixed stars have been, we believe, very much overlooked. In his memoir in the *Philosophical Transactions* for 1814 he mentions that in 1798 he made some experiments on the light of a few of the stars of the first magnitude, by a prism applied to the eye-glasses of his reflectors, adjustable to any angle and direction, with the following results:—The light of *Sirius* consists of red, orange, yellow, green, blue, purple, and violet; *α Orionis* contains the same colours, but the red is more intense and the orange and yellow are less copious in proportion than they are in *Sirius*. *Procyon* contains all the colours, but proportionally more blue and purple than *Sirius*. *Arcturus* contains more red and orange, and less yellow in proportion than *Sirius*. *Aldebaran* contains much orange and very little yellow. *α Lyræ* contains much yellow, green, blue, and purple." Holden suggests that if we were to attempt to classify these stars by Herschel's observations alone we should put *Sirius* and *Procyon* into one type of stars, which have all the colours in their spectra; *Arcturus* and *Aldebaran* would represent another group, with a deficiency of yellow and an excess of orange and red in the spectrum; *α Orionis* would form a type of those stars, with an excess of red and a deficiency of orange; and *α Lyræ* would represent a sub-group of the first class. The correspondence with Secchi's types and representatives is almost complete.

There remains one other great section of Herschel's researches and discoveries, that relating to the nebulæ and clusters of stars. When he commenced his observations in 1774 very few of these objects were known. Messier's catalogue of sixty-eight such objects did not appear till 1784, and they were chiefly objects found in his long-continued search for comets. Lacaille contributed twenty-eight from his observations at the Cape of Good Hope. Herschel discovered more than 2500, which he distributed in classes as follows:—Class I. "Bright nebulæ" (288 in all); II. "Faint nebulæ" (909); III. "Very faint nebulæ" (984); IV. "Planetary nebulæ" (79); V. "Very large nebulæ" (52); VI. "Very compressed and rich clusters of stars" (42); VII. "Pretty much compressed clusters" (67); VIII. "Coarsely scattered clusters" (88). In addition he pointed out large spaces of the sky covered with very diffused and faint nebulosity, which do not appear to have been re-observed. Holden advises that they should be sought for with a powerful refractor, which would be less open to illusions than Herschel's reflectors, and that the instrument should be used in the way he adopted—in sweeping.

Throughout Prof. Holden's interesting memoir there is evinced the same enthusiastic admiration of Herschel and his scientific labours, and he concludes in the same strain. "He was born with the faculties which fitted him for the gigantic labours which he undertook, and he had the firm basis of energy and principle which kept him steadily to his work. As a practical astronomer he remains without an equal. In profound philosophy he has few superiors."

Lists of Herschel's scientific memoirs and of works bearing upon them, are appended to the volume which has formed the subject of our notice, and which, if it has a fault, is of only too limited extent to do full justice to a long life of discovery and research. We will reiterate the hope expressed by Prof. Holden in his preface, as we understand it, that some member of Sir William Herschel's family may at no distant period "let the world know more of the greatest of practical astronomers" . . . "of a great and ardent mind whose achievements are and will remain the glory of England;" and in this connection, that whatever may be found amongst his manuscripts (and as regards the drawings of the nebulæ, no less an authority than the late Prof. D'Arrest has expressed a strong hope of further publication) may at the same time be given to the astronomical public.[1]

BRITISH FISHES

Natural History of British Fishes: their Structure, Economic Uses, and Capture by Net and Rod. Cultivation of Fish Ponds, Fish suited for Acclimatisation, Artificial Breeding of Salmon. By Frank Buckland, Inspector of Fisheries. (London: Society for Promoting Christian Knowledge.)

IT would have been difficult for Mr. Buckland to produce a dull book on any question connected with the economy of our fisheries; his merit in this respect has tended, however, to lead him too much in an opposite direction. It is painful, now that we are deprived of the living presence of the genial naturalist and industrious fishery inspector, to write an unkind word regarding any branch of his life's work; but of this book we are compelled to say that we would have appreciated it better had it been less "familiar" and more scientific. That it should be full of interesting information about fishery matters was quite to be expected from the richness of the stores which its author always had at his command, and if Mr. Buckland had taken pains to digest the *matter* so lavishly extracted from *Land and Water*, and had likewise collated the miscellaneous information contained in the volume with care, he might then have enjoyed the satisfaction of presenting to the public a natural history of British fishes which probably would have compared satisfactorily with other good books of the kind. It is not too much to affirm that a carefully edited selection from the numerous essays contributed to the various blue-books to which the deceased gentleman was so voluminous a contributor, would have made a more interesting volume than the present work. The fact is, Mr. Buckland was nothing if he was not sketchy and rapid; he would not be tied down to severe statements, but preferred to give an off-hand opinion in a dashing way, no matter that he might find out within the year that what he had advanced was very far wrong. In the present volume, as a glance at the plethoric title-page will show, Mr. Buckland attempted too much, with the result that portions of the information conveyed are scrappy, while some of it is probably slightly imaginative: books and articles written in railway trains often enough provide hard work for the reader. In a preface to his work Mr. Buckland takes pains to point out how greatly we are deficient in *exact* knowledge of the habits of our sea-fish, of the times and places of their spawning, of the food they eat, and of the period at which they are able to repeat the story of their birth. Some of the many questions which are asked by Mr. Buckland we are under the impression he should himself have been well able to answer. Whether cods' eggs "sink or swim" has been often discussed, and the author ought to have been able to tell us the truth in that matter; but, on turning to the account given of the cod-fish in the present book (p. 50), it seems to be singularly deficient in its details of the natural history of that animal. So far as we can observe, no reference whatever is made to the theory of Sars with reference to the floating of the eggs, but a few pages relative to the personal adventures of the author are not wanting, whilst the old story of "the Logan fish-pond" is re-told with great circumstantiality. Twenty-five pages of the work are devoted to the salmon (*Salmo salar*), and the essay, confused as it is, is well worthy of perusal, although it contains, as do other portions of the book, a good deal about Mr. Buckland, and recapitulates, as usual from *Land and Water*, an account of some of the big fish in "my museum." It would be a tedious process to anatomise the contents of this "Natural History of British Fishes"; taking all that is written at its true value, we set down the work as an interesting collection of miscellanea. The account given of the Loch Leven trout (*Salmo Levenenses*) is exceedingly meagre, as is likewise the descriptions of several other fresh-water fishes, notably the vendace of Loch Maben. The most suggestive part of the present work is that which is devoted to "Pisciculture" (pp. 334 to 375). Under the title of "The Cultivation of Fish Ponds," much interesting matter is given, and a good deal of information that must be new to the uninitiated is set forth. But notwithstanding the many pleas for pisciculture which have at various times been advanced, it is questionable if the cultivation of other fresh-water fish than the salmon would *pay* as a food resource. A larger supply of trout would no doubt be welcome to the angler, because the trout is *the* fish of the angler *par excellence*; moreover in many places angling has now to be paid for, and lairds in Scotland who let their moors and lochs can always lease them to greater advantage when they are well stocked.

OUR BOOK SHELF

Proceedings of the Aberdeenshire Agricultural Association. (Fourth Annual Report, 1879-80.)

WE have here an account of the field and laboratory experiments carried out by Mr. Jamieson for the Aberdeenshire Association during the year 1879. The crops experimented on were turnips and oats. As before, the principal object in view was to ascertain the comparative manuring value of various phosphates in different states of aggregation. We can glance at only a few points in the results.

Mr. Jamieson claims to have shown that a finely powdered mineral phosphate, as, for instance, powdered coprolite, is nearly equal as a manure for turnips to the same amount of phosphate applied in a soluble form as a superphosphate, while the simply powdered phosphate is of course much cheaper than the manufactured manure. There is probably no doubt that on some soils a finely powdered mineral phosphate is sufficiently soluble to produce a considerable effect on the crop, if only the phosphate is applied in sufficient quantity, so as to present a considerable surface for attack; and to Mr. Jamieson belongs the credit of giving prominence to this fact, though it was by no means unknown before his experiments. There is however no reason for supposing that dissolved and undissolved phosphates have the same manurial value. When large doses of each are applied the manures may appear of equal value, because while the undissolved phosphate is sufficient for the wants of the crop, the dissolved phosphate is in excess of all requirements, and is therefore wastefully employed. Mr. Jamieson applies 100 lbs.[1] of phosphoric acid per acre both as dissolved and undissolved phosphate; that is to say, about 9 cwts. of bone ash and 5 cwts. of bone-ash superphosphate. Such a comparison is probably quite unfair to the soluble phosphate. For the small turnip crops obtained in Mr. Jamieson's experiments 2¼ cwts. of superphosphate drilled with the seed would be found quite sufficient, and probably fully equal in effect to twice the quantity of phosphoric acid applied as powdered coprolite.

---

[1] On page 15 of the appendix the amount of phosphoric acid applied per acre is stated to be 100 lbs., but on page 16 the quantity is given as 200 lbs.

Phosphate of iron applied alone was found to have practically no effect on the turnip crop, and the effect of phosphate of aluminium was but little; this is pretty much as we should expect. There is apparently some mistake in the printed analysis of the phosphate of aluminium used, as it is made to contain 38·28 per cent. of lime, and only 4·76 per cent. of ferric oxide and alumina.

The analyses given of the turnip soils cannot pass without a word; the reporter is surely unaware of the absurdity which these analyses present. The soil of the unmanured plot in the five experimental fields was analysed in 1876, and again in 1879, after three turnip crops had been taken. The analyses show that on an average about 20 per cent. of the nitrogen, and about 48 per cent. of the phosphoric acid in the soil had been removed during these three years, and yet the total weight of the three turnip crops grown on the five fields during this period averaged but 16 tons per acre! The only remark made by the reporter on these figures is that the soil has evidently become reduced in nitrogen, and much reduced in phosphates; the fact that either the soil sampling or the analyses must be utterly wrong seems to have altogether escaped his attention.

The experiments with oats do not call for any special remark, except to note the patience which shelled 136,000 grains by hand in order to determine the proportion of kernel to husk in the produce of the various plots.

May we suggest that in a report of field experiments the dates of sowing and of harvest should always be given, and also a description of the character of the weather during the growing period. Without such facts before us it is impossible to interpret the results of field experiments.

Proceedings of the London Mathematical Society. Vol. xi. (November, 1879, to November, 1880).

THIS is a smaller volume than usual, there being fewer papers, and none of them of a great length. The pure mathematics prevails somewhat more than usual over the mixed.

Prof. Cayley contributes articles "On the Binomial Equation $x^p - 1 = 0$; Trisection and Quartisection," a theorem in spherical trigonometry, on a formula of elimination. Sir James Cockle writes "On a Binomial Biordinal and the Constants of its Complete Solution." Mr. J. W. L. Glaisher, "On a Method of obtaining the q-formula for the Sine-amplitude in Elliptic Functions"; Mr. H. W. Lloyd Tanner, "Notes on a General Method of Solving Partial Differential Equations of the First Order with several Dependent Variables," and a preliminary note on a generalisation of Pfaff's Theorem; Mr. J. J. Walker, "Theorems in the Calculus of Operations"; and Mr. T. R. Terry, "Notes on a Class of Definite Integrals." Papers of a geometrical nature are—Mr. J. Griffiths, on a geometrical form of Landen's theorem with regard to a hyperbolic arc, and on a class of closed curves whose arcs possess the same property as two Fagnanian arcs of an ellipse; Mr. H. Hart, on the focal conics of a bicircular quartic; Mr. H. M. Taylor, on the equation of two planes which can be drawn through two given points to touch a quartic; Rev. J. Wolstenholme, a form of the equation determining the form and directions of a conic whose equation in Cartesian co-ordinates is given. Dr. Klein of Leipsic has a short note on the transformation of elliptical functions; Mr. Greenhill applies elliptic co-ordinates and Lagrange's equations of motion to Euler's problem of two centres of force; and Mr. Routh writes on functions analogous to Laplace's functions. Lord Rayleigh's papers are on reflection of vibrations at the confines of two media between which the transition is gradual, and on the stability or instability of certain fluid motions. Mr. Samuel Roberts has two notes: one on a problem of Fibonacci's, and the other on the integral solution of $x^3 - 2Py^3 = -z^3$ or $\pm 2z^3$ in certain cases; Mr. R. F. Scott writes on cubic determinants and other determinants of higher class, and on determinants of alternate numbers (a treatment which he has adopted in his work on "Determinants"). Mr. Hugh McColl contributes a fourth paper on the calculus of equivalent statements (cf. Prof. Jevons's remarks, NATURE, vol. xxiii. p. 485). Other minor articles conclude the volume.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

The New Museum of Natural History

THE new Natural History Museum, opened on Easter Monday, was visited by some 16,000 people of a most orderly and respectable class. Owing to the great exertions of Dr. Woodward, whose zeal is beyond praise, the main gallery, the Pavilion, and the Gallery of Reptiles were shown in a practically completed state. The Mineral Gallery has long been ready, but the arrangement of the botanical section is still incomplete, and it was entirely closed. Some little trouble was caused with the umbrellas, and it might be worth while to consider whether, except perhaps in wet weather, the umbrellas need be taken away. The idea that people poke with sticks at objects in museums has been long exploded, and no inconvenience is felt at the Kensington Museum, the Louvre, and nearly all foreign galleries and exhibitions, where umbrellas are admitted.

The architecture in the Mammalia Gallery is very obtrusive, and its over-ornate character and the variety of tone of the terra-cotta, and the similarity of this in colour to the skulls and skeletons of the fossil mammalia, are most unfortunate.

It seems a pity that some style with more repose than "Decorated Norman" was not selected. Although very beautiful as a building, and with many features deserving high praise from an architectural point of view, it is evidently not the style best adapted to set off natural-history specimens. The cathedral-like Index Museum, with its rather dark side-chapels, and the Museum of British Zoology are of proportions that will render it difficult to make an effective display in them.

I hope that it is not finally decided to place the recent mammalia on the first floor and the birds on the ground floor, because the architect's string courses would be interfered with otherwise by the cases. The living and extinct mammalia should face each other, and the birds go aloft. Convenience has already been too much sacrificed to architecture. Every time the first floor is visited the length of the Index Museum, 150 feet, must be traversed to reach the stairs, and the same distance back along the corridor to reach the door of the Mineral Gallery. This means an immense waste of time. I also notice that the crane is close to the main entrance, and that there are no proper lifts.

If it was necessary to fashion all the ornaments from natural-history objects, it is a pity that the restorations were not accurately made. The oft-repeated figure of a Dapedius swallowing a fish almost its own size, and of spiral shells bent to accommodate them to the mouldings of an arch, is not instructive. The humour of ornamenting (?) the arch leading into the pavilion with a hideously-represented Archæopteryx in high relief, repeated a dozen times, is not obvious, but some joke must doubtless be intended.

The cost of the small bronze and glass conservatories in the botanical department is out of all proportion to the objects they are to contain. Dried stems of tree-ferns and palms, though very interesting in their way, do very well in other museums without glass cases, and can be replenished for next to nothing.

F. G. S.

The Tide-Predicter

MR. EDWARD ROBERTS' letter in NATURE for April 14 contains statements giving an erroneous view of the origin of the tide-predicter. Any one who feels sufficient interest in the subject to derive full information will find it in my paper on "The Tide-Gauge, Tidal Harmonic Analyser, and Tide-Predicter," read before the Institution of Civil Engineers on March 1 and in the abstract of the discussion which followed it, to be published in the *Minutes of the Proceedings* of the Institution (vol. lxv. sess. 1880-81, part iii.), and he will see that my letter in NATURE of March 31 is correct. WILLIAM THOMSON

Geological Relations of Gold in Nova Scotia

IN the notice of the report of Mr. Murray on the gold of Newfoundland (NATURE, vol. xxiii. p. 472) I observe a reference to my own opinion of the age of the gold of Nova Scotia which needs some correction. In the second edition of "Acadian Geology" (1868) the gold-bearing series is included in the Lower Silurian, but this referred to the larger sense of that term in which it was used to include the Cambrian as well. In the third edition (1878, Supplement, pp. 81, 85, 92) I have referred this formation, on the evidence of fossils and stratigraphical position, to the age of the Lower Cambrian or Longmynd series, thus placing it on a lower horizon than the fossiliferous Primordial of Eastern Newfoundland, which I suppose to be of the age of the Acadian or Menevian group. There is therefore little difference between Mr. Murray's estimate of the age of the gold-bearing rocks of Newfoundland and my own of that of the similar rocks in Nova Scotia, except that I presume he would classify the Newfoundland series as Upper Huronian rather than Lower Cambrian. With reference to this I have been disposed to regard Mr. Murray's *Aspidella* slates and the associated rocks as equivalents of the Kewenian or "Upper copper-bearing group" of the West, and probably Upper Huronian, in which case they might be a little below my Nova Scotia Lower Cambrian; but the precise age of both series is determined merely by the fact that they appear to belong to the period between the Huronian proper, or Lower Huronian, and the Acadian group, or Menevian (Étage C. of Barrande).

It is proper to add that in the third edition of "Acadian Geology" I have shown that the filling of the Nova Scotia gold veins is much more recent than the containing rocks, and belongs to the time intervening between the Upper Silurian and the Lower Carboniferous, the richer deposits also appearing to be related to the occurrence of intrusive granites of Devonian age. There is no reason, therefore, other than the mineral character of the containing beds, why such veins might not occur in any rocks older than the Devonian, and gold discoveries have been reported in localities where the rocks are supposed to be Huronian and Silurian; but I have had no opportunity of personally verifying these statements. Thus far the important gold veins are known only in that great series of slates and quartzites of the Atlantic coast which I have referred to the Lower Cambrian. J. W. DAWSON

McGill College, Montreal, April 4

Symbolical Logic

PROF. JEVONS, in his criticism of my method in NATURE, vol. xxiii. p. 485, has stated the main points at issue between us so fully and clearly, and on the whole so fairly, that I need only say a very few words in reply.

As to the charge that my method is ante-Boolian or anti-Boolian, I do not seek to repel it; on the contrary, I maintain that my method is different from Boole's in principle, and very different indeed in its practical working. The really important questions to be settled are these:

1. Are the definitions which I give of my symbols clear and unambiguous?

2. Are the rules and formulæ which I derive from these definitions correct?

3. Are the innovations which I propose of any practical utility?

Now, I do not think that any one who has read my papers in the *Proceedings* of the London Mathematical Society and my articles in *Mind* and in the *Philosophical Magazine* will refuse to answer *Yes* to questions 1 and 2; and with regard to question 3 I can only say that any one who answers *No* is bound in fairness to prove the inutility of my innovations by solving one or two of my hardest problems without their aid, and in an equally clear and concise manner. My proposal of an amicable contest in the *Educational Times* meant nothing more serious than this.

Some of my critics (not including Prof. Jevons however) seem anxious to magnify the points of resemblance between my method and its predecessors, especially Boole's, and to minimise the points of difference. It may be as well therefore to state briefly what characteristics distinguish my method, so far as I know, from all the methods which have preceded it, and what advantages, in my opinion, accompany these characteristics.

In the first place, then, every single letter in my notation, as well as every combination of letters, denotes a *statement*. By this simple device I gain the important advantages of generality of expression and uniformity of interpretation and treatment. It enables me to express many important logical laws in simple and symmetrical formulæ, as, for instance,

$$(A : a)(B : b)(C : c) : (A + B + C : a + b + c),$$

which otherwise could not be so expressed. To secure these advantages I sacrifice absolutely nothing. The relations of classes, including the ordinary syllogisms, I express by speaking throughout of *one individual*, just as mathematicians express the properties of curves, surfaces, and volumes, by speaking throughout of the varying distances *of one representative point*.

My claim to priority on this head has been called in question on the ground that Boole too, in his equations about "secondary propositions," denotes statements by single letters. The plain truth however is that Boole takes some pains to prevent his readers from imagining that he does anything of the kind. He says distinctly, and in perfect consistency with the whole tenor of his book, in which he describes his algebra of logic as a mere offshoot and part of the ordinary algebra of quantity, that in his equations any single letter, such as x, denotes the *portion of time* during which some proposition x is true, the whole universe of time to which the discourse refers being the unit (see "Laws of Thought," from p. 164 to p. 170). Neither will one find anywhere in Boole's work the idea (suggested to me by analytical geometry) of investigating the relations of different classes, while speaking only of *one individual*, and thus dispensing entirely with the quantitative words *all*, *some*, and *none*, which are so characteristic of the old logic.

Another peculiarity of my method is that my symbol of denial (an accent) is made repeatedly to apply to expressions of varying complexity, as, for instance, $(xy)'$, $(x + yz)'$. $(z : y')'$, leading to rules and formulæ of operations, to which I find no parallel in any prior symbolic system with which I am acquainted.

Boole uses $\bar{x}$ as an abbreviation for $1 - x$. Let those who insist that Boole's horizontal stroke is exactly equivalent to my accent express in his notation the complex equation

$$(x = y)' = (x : y)' + (y : x)',$$

and explain its meaning clearly *without departing from Boole's quantitative interpretation of his symbols*.

Lastly, my symbol : expresses *implication* or *inference*, and does not, therefore, exactly coincide in meaning with Prof. Peirce's symbol of inclusion —<, as defined by him in his "Logic of Relatives," published in 1870. This symbol of inclusion, as I understand Prof. Peirce's definition of it, is simply equivalent to the words "is not greater than," and is therefore restricted to number and quantity. It is true that Prof. Peirce in his recent memoir on the "Algebra of Logic" extends the meaning of this symbol of inclusion, so as to make it also convey the same meaning as my symbol of implication; but as this memoir was published subsequently to my second and third papers in the *Proceedings* of the Mathematical Society, to which Prof. Peirce explicitly refers in his memoir and accompanying circular note, this later definition does not bear upon the point in discussion.

Prof. Jevons objects to my $\alpha : \beta$ as an abbreviation for $\alpha = \alpha\beta$, because he thinks it obscures the real nature of the reasoning operation. But one might with equal justice object on the same grounds to α^3 as an abbreviation for $\alpha\alpha\alpha$, or to the left side of the equation in the binomial theorem as an abbreviation for the right side. The symbol $\alpha : \beta$ is the exact equivalent of $\alpha = \alpha\beta$, just as $\alpha = \beta$ is the exact equivalent of $(\alpha : \beta)(\beta : \alpha)$, and I do not see that I create any obscurity by adopting in any investigation, and at any stage of the investigation, whatever form seems most suitable for the immediate purpose in view. But whether I am right or wrong in this opinion can only be decided by actual examination of my published papers on symbolical logic, of which Prof. Jevons has very kindly given in Nature a full and complete list. Hugh MacColl

Agricultural Communism in Greece

The article in Nature, vol. xxiii. p. 525, on Aryan villages and other Asiatic communities reminds me of what I saw in 1843 in the course of a journey through Greece. On St. George's Day, a high festival with the Greek peasants, when crossing the range of Mount Cithæron between Thebes and Eleusis, I saw my companion, who was about half a mile ahead, surrounded by a number of men, and then pulled from his horse. The man we had engaged as interpreter, guide, and protector, the "dragoman," bolted as a matter of course, thinking we had fallen upon a nest of brigands; but when I reached the scene of action I was surprised to find that the yelling and uproar heard in the distance were not murderous nor at all malignant, but purely hilarious. I was dragged from my horse also, and surrounded by about twenty young fellows with shaven heads and long scalp locks, half stripped, half drunk, and very dirty, but perfectly good-humoured.

We were presently made to join in a wild dance, a survival of the Pyrrhic dance of antiquity, which we improved very successfully; my companion, C. M. Clayton, from Delaware, doing a nigger break-down and I the sailor's hornpipe.

On the final arrival of our dragoman we learned that the twenty young men were brothers, and that the old man with long white beard who sat gravely looking on and playing a sort of tom-tom to tune the dance was their father. On our expressing surprise at so large a family of sons being so nearly of the same age he explained that ἀδελφὸς did not always signify a blood relation, and that these were merely *agricultural* brethren. They were the united proprietors or renters (I do not remember which) of the adjoining farmhouse and the surrounding land, which they cultivated under the direction of the old man whom they had selected as their father, who was entrusted with the custody and division of their capital and profits, who arbitrated in cases of quarrels, and was otherwise obeyed in most things.

Here was a patriarchal form of communism that we afterwards met with in several other instances, but in this and the other cases it was limited to young unmarried men. There were no women in the dance and none visible on this farm, which was some miles distant from the nearest village, Platæa.

At that time the Klephts, or brigands, were united in similar communities, who sternly abjured all communication with the fair sex.

When we had finished our dance and paid for sufficient wine to go round the family circle we found that before going we must kiss all the brothers or give mortal and dangerous offence. Andrew, our dragoman, with the inventive facility of his nation, extricated us from this by solemnly stating that in England it was an established custom to show respect for a family by embracing the father only, and bowing separately to each of the sons.

I am unable to supply any further particulars concerning the internal economy of these communities, cannot say whether they prevail chiefly among the Greeks or the Albanians (the latter constitute a large proportion of the agricultural population of Greece), nor how they dissolve when the brothers become married or the father dies. I have met with no account of them in the course of my reading, but am not at all surprised at this, seeing how profound is our general ignorance of everything pertaining to Greece, an ignorance which is most glaringly displayed by political writers and others, who speak of Athens as though it were Greece, and of Athenian proceedings as though they were the action of the Greeks.

But for the accident of this rather startling festive encounter with these brethren on this particular holiday, we might have travelled for weeks without meeting any visible indications of such fraternities. We should have passed the brothers if they were working in the fields, and the patriarch had he been sitting alone at the farmhouse door, without special notice. It was only after our curiosity had been excited that we discovered other patriarchs and other brethren by special inquiry where their existence was vaguely indicated.

Among the readers of Nature there may be some who have sufficient acquaintance with the Greek people, outside of Athens, to be able to supply interesting particulars concerning these curious communities. They may be survivals of our ancient communism, or a modern device for mutual protection forced upon the rural population by the absence of any enforcement of law and social order by those who consume the taxes in Athens.

W. Mattieu Williams

Heat of Stellar Masses

I send you a working hypothesis which I think will well pay for its place in the world. It is as to the heat of large stellar masses; that the imperfect conduction of the kinetic force producing gravitation through large stellar masses causes heat in them.

The quantity of heat stored up may depend partly on the proportion of mass to radiating power, and partly, perhaps, on the condition of the mass for such conduction.

Washington, D. C., March 25 Saml. J. Wallace

Shadows Cast by Venus

On March 21 last, about 8 p.m., I was walking among some trees by a river's bank. The ground was covered with recently-fallen snow, and the shadows of the trees were unmistakably, though faintly, traceable on the white surface. The night was dark and the shadows were thrown by Venus, which was shining with unusual brilliancy. I believe this obvious form of the phenomenon is not a common one in our latitude.

The Sparrow and Division of Labour

The following curious fact may possibly interest your ornithological readers:—Last year and the year previous two pairs of swallows made their nests and successfully reared their broods under the eaves of my house. Within the past fortnight a brace of astute London sparrows have apparently recognised the principle of division of labour as applicable to their requirements in the art of nest-building. They have selected the largest and most substantial of the swallows' nests referred to; and, after devoting a day or two, on starting on their enterprise, to the enlargement of the entrance hole, which was probably too narrow for them, have constructed their bed within of bits of grass and feathers in the usual fashion. They are now enjoying their honeymoon in their new quarters. G. C. Wallich

SIR PHILIP DE MALPAS GREY EGERTON, M.P., F.R.S.

In Sir Philip Egerton geologists have lost one of that band of workers who placed their science upon the footing which it now occupies in this country. Unfortunately that band has been of late years greatly diminished by death. Born in 1807, Sir Philip Egerton with his old friend and fellow-worker, Lord Cole (now the Earl of Enniskillen), while still at Oxford commenced the collection of fossils, and very soon their attention was especially directed to fossil fish, of which but very little was at that time known. As specimens of this group of organisms often occur in duplicate, the individuals breaking across so that two opposite slabs each contain one-half, the two friends agreed to share their spoils, and thus both collections were enriched. When in 1840 Agassiz visited this country, intent upon his great ichthyological memoirs, he found in the museums of Sir Philip Egerton and Lord Cole an abundance of materials ready to his hand. The specimens were carefully figured, and descriptions of them included in the several great works which Agassiz successively issued. The original drawings by Dinkel are *now* among the archives of the Geological Society. But Sir Philip Egerton was by no means merely a collector of fossils, he was a very diligent and successful student of ichthyology. Many valuable papers on fossil fishes were written by him at different times, and a series of papers published in the decades of the Geological Survey of the United Kingdom are among the most valuable of the works issued by that body. An excellent man of business, Sir Philip took an active part in the administration of the British Museum, the London University, the Geological Society, and other institutions for the promotion of science. All who knew him will miss the kindly face and cheerful manners which distinguished him. Only two days before his death he was in his place in Parliament, but a chill caught during the lately prevalent east winds proved rapidly fatal. At the last meeting of the Geological Society the vice-president, Mr. J. Whitaker Hulke, F.R.S., made announcement of his death, and the sudden and unexpected tidings concerning one who was so widely known and so universally respected cast a sad gloom over the proceedings of the evening.

A correspondent sends us the following additional note on the late Sir Philip Egerton:—

The knowledge of the extinct species of fishes is one of the latest additions to palæontology, and the creator of this department of the science, Louis Agassiz, found the richest materials for his great work in the British Isles. In their acquisition he was greatly aided by Lord Cole, now Earl of Enniskillen, and by Sir Philip de Malpas Grey Egerton, Bart., M.P. Their gatherings resulted in most complete collections of fossil fishes, and science is much indebted to the catalogues drawn up and published by Sir P. Egerton of that preserved at Oulton Park. Besides the species named by Agassiz this collection includes many which have been subsequently determined and described by Sir P. Egerton, whose name will be ever associated with that of Agassiz in palichthyology. In his public career Sir Philip Egerton has been distinguished by his unremitting attention to his parliamentary duties in the long period since his election in 1830. The British Museum sustains a severe loss in a Trustee, elected in 1851, whose scientific knowledge, sound judgment, and administrative ability were of the greatest value, especially to the Natural History Departments. Sir Philip's last attendance at the Board was but a few days—apparently in his usual good health—before his lamented death.

THE SCIENTIFIC PRINCIPLES INVOLVED IN ELECTRIC LIGHTING

FOUR Cantor Lectures on this interesting subject have just been delivered at the Society of Arts by Prof. W. Grylls Adams, F.R.S.; the lectures will be published in full in the *Journal* of the Society of Arts, but we are able to give an abstract of them by Prof. Adams. In the first lecture, the discoveries of Œrsted, Ampère, Arago, and the early discoveries of Faraday on magnetic and current induction were considered in their relation to the principles of conservation and transformation of energy.

Lecture I.—Prof. Adams began by stating and illustrating the fact that important discoveries, after they are made, often pass through a stage of neglect or a stage of quiet development, then enter on the practical stage, when new facts and new inventions follow with great rapidity. The potential energy of the discoverer is transformed into energy of action in many directions with more or less efficiency, according to the retarding state of the medium through which that action takes place.

Electrical science has passed through these stages, whether we regard telegraphy from the work of Sir Francis Ronalds in 1816, who said, "Let us have electrical *conversazione* offices communicating with each other all over the kingdom," down to the establishment of telephonic exchanges, or whether we consider electric lighting from the grand experiment of Sir Humphry Davy in 1813 with a battery of 2000 cells, down to the latest results obtained by means of the most recent magneto- or dynamo-electric machines.

In the year 1819 Œrsted observed the action of a current of electricity on a suspended magnetic needle, and in the year 1820 Ampère studied the laws of their mutual actions, and propounded his celebrated theory of magnets and of terrestrial magnetism, making magnetism the resultant action of electric currents. In the same year Arago discovered the magnetisation produced by electric currents, laying the foundation of the subject of electro-magnetism.

The discoveries of Œrsted, Ampère, and Arago were fully illustrated by experiments, and their connection with one another explained. In the same year, 1820, Schweigger invented the galvanometer, and in 1827 Ohm deduced his simple theory of the action of batteries from the principle of Volta.

The relation of the experiments of Œrsted, Ampère, and Arago to the principle of conservation of energy was then fully considered. Considering Ampère's experiment of the motion of wires towards one another when like parallel currents are flowing in them, it was shown that the currents must be diminished whilst they are actually approaching, and increased whilst they are separating, and so by supposing one of the original currents very small, the relation between Ampère's results and the induction of a current by moving a wire in the neighbourhood of another current was deduced.

The laws of induced currents were then explained and illustrated by some of the early experiments of Faraday, who discovered the induction of electric currents by magnets in 1831.

"In his first series of papers to the Royal Society entitled—(1) On the Induction of Electric Currents, (2) On the Evolution of Electricity from Magnetism, (3) On a New Electrical Condition of Matter, (4) On Arago's Magnetic Phenomena, Faraday unfolds step by step the laws of the induced current in a helix of wire B, placed near to another helix A, carrying a voltaic current.

"That as long as a steady current was maintained in A there was no current induced in B; that on making contact in A or on approaching the wires there was a momentary inverse current in B, and on breaking contact in A or on separating the wires, there was a direct induced current in B. That as this current was of the nature of an electric wave like the shock of a Leyden jar, it might magnetise a steel needle, although it produced slight effect on a galvanometer, and how this expectation was confirmed, and that the needle was magnetised opposite ways on making and on breaking contact." Then in his evolution of electricity from magnetism he gives an account of the greatly increased effects on introducing soft iron cores into his helices of wire, and shows that similar effects are obtained by using ordinary magnets in place of a helix carrying a battery current round an iron core, *i.e.*, in place of an electro-magnet. He then describes the experiment of introducing a magnet into a coil of wire, and shows that the same current is obtained whether the marked end of the magnet be introduced at one end of the coil or the unmarked end introduced at the other, and that a current is produced in the opposite direction to the former on withdrawing the magnet from either end. Then after describing the method of producing his induction spark and also muscular contractions of a frog by means of a loadstone and coil, and remarking that the intensity of the effect produced depends upon the rate of separation of the coil from the poles of the loadstone, he concludes this section thus: An agent which is conducted along metallic wires in the manner described; which, whilst so passing, possesses the peculiar magnetic action and force of a current of electricity; which can agitate and convulse the limbs of a frog, and which finally can produce a spark, can only be electricity.

Faraday also observed the difference of time between induction by a battery current in a coil, which is instantaneous, and induction by a magnet, which requires an interval of time to get up to its full value; and accounted for this retardation by supposing that there is a redistribution of the Amperian currents in the iron itself, so that the magnet requires time to rise to its full power.

Little did Faraday dream of the rapid development and the marvellous results which were to flow from his experiments when, fifty years ago, he established the laws of magnetic and current induction, being stimulated (as he says) to investigate experimentally the inductive effects of electric currents with the view of elucidating Ampère's beautiful theory of magnetism, and in the hope of obtaining electricity from ordinary magnetism.

Lecture II.—It was shown in the last lecture that a circular current or a current in a coil of wire acted as a magnet, one face of the coil, in which, as we look at it, the current appears to go contrary to the hands of a watch, corresponding to the marked pole or the pole of a magnet which points to the north, and the opposite face of the coil corresponding to that pole of the magnet which points to the south. Each of the Amperian circular currents in the separate molecules of a magnet is equivalent to a fine magnet with poles of the same magnetic strength as the current, and occupying the same position, and the collection of Amperian currents will have the same magnetic effect as the bundle of small magnets, each of which gives the direction of the magnetic force at the point. These separate fine magnets may be regarded as Faraday's lines of force, and the number of them issuing from a magnetic pole will be a measure of the strength of the magnet. The magnetic field of the magnet is any portion of space to which the influence of the magnet extends. The current which will be produced by the motion of a conducting wire in the magnetic field will be proportional to the strength of the magnetic field, *i.e.* proportional to the number of lines of force cut by the conductor; so that the current produced in each half turn of a coil of wire revolving on an axis is proportional to the number of lines of force cut by the coil during its rotation, so that the total current from the coil will be proportional to the number of lines of force multiplied by the number of times the wire is repeated in the coil. In the case of a coil of wire rotating in the field of a magnet, if the axis of rotation is parallel to the lines of force no current is produced, but as the axis of rotation is turned more and more nearly at right angles to the lines of force the current in the coil is increased. Taking the earth for our magnet, when the axis of rotation is perpendicular to the lines of force and still in the magnetic meridian, the current in that half of the coil which is moving from west to east will be from north to south, and the current in the other half of the coil which is moving from east to west will be from south to north, so that in the whole coil we get during every half turn an all-round current in one direction in the coil. The direction of the current in the coil, as we look at it from the east, is the same as the direction of rotation of the coil as we look at it from the north. The direction of the current in the coil is alternately in opposite directions for every half turn, but a continuous current may be obtained from it by reversing the connections with the ends of the coil by a commutator at the same instant as the currents are reversed in the coil.

These are the principles of all magneto-electric machines. The distribution of lines of force in the magnetic field of currents and of magnets is well shown by projecting some of Prof. S. P. Thompson's transparencies, which show the magnetic effects resulting from the mutual action of currents and magnets on one another.

After the discovery by Faraday, in 1831, of the method of producing a current of electricity by the sudden removal of a coil of wire from the pole of a magnet, the laws of these currents were being developed, but for twenty years no attempt was made to apply them for the purposes of electric lighting. Voltaic batteries were being improved, and the more constant batteries of Daniell, of Grove, and of Bunsen were discovered, and these were the sources of electricity employed to produce the more powerful currents of electricity. In this country forty or fifty cells of Grove have given us the electric light for optical experiments in our laboratories, and the light was kept steadily in the same position by the elaborate arrangements of wheel-work and electromagnets devised by Staite in 1847 and by Foucault, which have reached very great perfection in the hands of Duboscq. In the Duboscq lamp the current passes always in the same direction, and the positive carbon becomes hollowed out, and burns away about twice as fast as the negative carbon, which becomes pointed. The carbons are moved towards one another by means of a drum carrying two wheels, whose diameters are as 2 to 1, which move two racks which bring the carbons together This lamp is especially adapted for projection on a screen, and we may study the forms of the carbons by projecting them, and also study the kind of light given out by the vapours of metals burning in the arc; if we burn silver in the arc we shall see that it is rich in the violet or chemical rays, which points to the reason why the salts of silver are so much used in photography.

Even with constant batteries there is great variation in the steadiness of the electric light, but much more is this the case when the current of electricity is obtained by the motion of a coil of wire in a magnetic field, for every alteration in the resistance in the circuit reacts on the machine producing the current so as to increase the disturbance. Hence regulators are necessary in order to control the current, so as to keep the light constant. In electric lighting regulators may act on the electric lamps themselves so as to give a steady current between the carbons by keeping them the same distance apart, or regulators may be used in another part of the circuit to control the current automatically by causing it to introduce extra resistance when the current increases, and to diminish the resistance when the current diminishes.

Various methods of regulating the current, including those employed by Siemens, Lane Fox, and Edison, were then described. In order to find the yield or effective work of batteries or magneto-electric machines and their efficiency, measurements of the current and of the work done by the current must be made.

There are four principal methods of measuring electric currents:—

1. The galvanometer method, by which with a galvanometer of small resistance a very small fraction of the current is measured, and any error of observation is multiplied in estimating the total current flowing.

2. The heat method, in which the current is measured by the heat developed by the current in a given resistance in the circuit according to Joule's law, that the heat is proportional to the square of the strength of current.

3. The electrometer or potentiometer method, in which the difference of potential between two points in the circuit with a given resistance between them is directly measured and the current deduced from Ohm's law.

In using Thomson's quadrant electrometer for strong currents, the needle and one pair of quadrants should be connected together, so that the deviation is then proportional to the square of the difference of potential, and this method is applicable for continuous currents and also for alternate currents. By means of two electrometers in different parts of the circuit the current and also the work done by it may be at once measured. If, for instance, one of the electrometers be connected with the two carbons, the difference of potential and work done between the carbons may be determined. By such measurements it has been found that there is an electromotive force of 30 or even 40 volts between the carbons in the electric arc, but that the actual resistance of the arc is small.

4. The electro-dynamometer method, the best method fitted for ready measurement, in which the current in one coil is attracted by the same current flowing in another coil, and the attraction is balanced by a spring as in Siemens's electro-dynamometer, or by weights as in Trowbridge's electro-dynamometer. A beautifully-made instrument by Elliott and Co. was exhibited, in which the coils are thick copper bands, fixed coils being placed on each side like the coils of a tangent galvanometer, the suspended coil being placed between them in place of the magnet of the galvanometer. This instrument is especially useful for the measurement of very large currents in absolute measure.

The remainder of the second lecture was devoted to the consideration of the efficiency of batteries or of magneto-electric machines when employed as motors to do work by means of electricity, and it was shown that the greatest amount of effective work is produced when one-half the energy of the battery or current-generating machine is converted into useful work in the electric circuit. Numerous experiments were made with Clarke's and other magneto-electric machines to show that by the same machine work may be produced by sending a battery current through it, causing motion of the armature carrying the current in accordance with Ampère's laws, or a current of electricity may be generated by turning the armature, *i.e.* by doing work upon the machine, so that a magneto-machine is a reversible engine. A small magneto-machine with a Siemens armature was made to work a pump, or when turned by hand produced a current of electricity. Also a battery current in a Gramme ring in front of the poles of a Jamin magnet caused rotation of the ring and turned the heavy driving-wheel of the machine, and on removing the battery and turning the driving-wheel by hand, a current of electricity was produced which caused a piece of platinum wire to glow. Also a Tisley's hand dynamo-machine was employed either to heat a long piece of platinum wire or to drive another magneto-electric machine, so producing a secondary current capable of heating a considerable length of platinum wire.

(*To be continued.*)

THE FRENCH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE AT ALGIERS

Algiers, April 14

THE number of members enrolled for the present Congress is much larger than might have been expected when we consider the length of the journey. To a Parisian member this is such as would be experienced by a Londoner if our British Association met in Gibraltar. Yet more than 1500 names are on the list. Few of these are familiar to us. There appear to be an unusual number of doctors and professors of anatomy and physiology, and of civil engineers. We fear we must also confess that a great many people possessing little or no interest in science, who will not be present at a single sectional meeting, have joined the Association for the sake of seeing Algiers. The general character of the meeting appears to be that of a great excursion. There are only five days partially devoted to work; while the banquets, balls, fêtes, courses, and "fantasias" are rapidly multiplying.

On arriving in Paris we were told that the steamer which was to have conveyed us to Algiers had been requisitioned by the Government for the transport of troops to Tunis; but the Company determined at last to take both soldiers and *savants*, and the result was of course an overcrowded boat and excessive discomfort. With accommodation for fifty first-class passengers no less than one hundred and twenty-nine were crowded into the vessel, and had the voyage been anything but of the smoothest, it would have been most wretched. As it was it was bad enough; the food was insufficient in quantity and detestable in quality, and passengers were glad to find six feet of floor to sleep upon. In Algiers itself the hotels are quite full, and the salons will be used as dormitories.

The Congress will be opened to-day by the inaugural address of M. Chauveau, which is to be given in the theatre at three o'clock, after which the members will remain and resolve themselves into a general committee to discuss the creation of a sixteenth section relating to pedagogy; afterwards the secretaries of sections will meet to arrange their proceedings, and at 9 p.m. the members will be received by the Municipality at the Hotel de Ville. The general programme for the rest of the week is as follows:—

Friday, April 15.—Sectional meetings in the forenoon; general meeting at 2 p.m.; conference at half-past 8.

Saturday.—Sectional meetings in the morning; visit to the Algerian Exhibition in the afternoon; Arab *fête*, and a *soirée* given by the Municipality.

Sunday.—"Courses et fantasia."

Monday.—Sectional meetings in the morning; a procession through the town in the afternoon, and an Arab *fête* in the evening.

Tuesday.—Sectional meetings; general concluding meeting; in the evening a ball given by the Governor.

On *Wednesday* the excursions commence; they are both general and sectional, and the longest lasts for a fortnight.

A complete list of the papers to be read has not yet appeared, but in the list already published we do not note anything of special interest.

English science is represented by Dr. G. H. Gladstone and Mr. Siemens, who will both read papers.

The Association has presented to each member a work in two volumes entitled "Notices scientifiques, historiques, et economiques sur l'Alger et Algérie."

April 15

The theatre was well filled yesterday afternoon to hear the address of the president, M. Chauveau, who is Professor of Physiology in the Lyons Veterinary College. His discourse was of a far too technical character to be of interest to the majority of his audience, and dealt principally with the germ theory and Pasteur's theory of fermentation. It was read throughout without the least attempt at oratory, and it contained various political allusions which were much applauded. In the evening the members were entertained by the Municipality, and the town was illuminated. The real work of the Association commenced this morning, when the sections met at hours varying from eight to ten o'clock. We fear that the number of papers is small, and that the Association does not represent French science at all completely. In the Physical Section, for example, the names of only two authors of papers appear to-day—MM. Brillouin and Crova. At 9 a.m., when the section was announced to meet, no one was present. Shortly afterwards the secretary arrived, but an hour later the section had not met. The average number of the audience at the sections which had already met did not at this time exceed *ten*.

Among the more interesting papers announced for to-day are the following:—M. Marcheray, on Telephonic Communication in large towns; M. Tacchini, on the Observatories of Etna and of Chimona; M. Thoulet, on the Employment of the Microscope in Chemical and Physical Researches connected with Mineralogy; M. Prungrueber, on 300 Anthropological Observations on the Kabyles of the Djurdjura Mountains.

The Medical and Agronomical Sections have plenty of communications. The new section of Pedagogy has been established under the honorary presidency of M.

Godard, Director of the École Monge in Paris, who has brought twenty of the pupils with him. M. Fau, Attorney-General of Algiers, is the President, and two papers are announced for to-day:—One by M. Robert, on the Humanitarian and Pedagogic Ideas of Jean Comimiac (1572-1670); the other by M. Berdellé, on the Employment of Colours as a Means of Retaining in the Mind certain given Numbers.

An excellent geological map of Algiers to the scale of 1 in 800,000 has recently been completed, and the formation of it has led to the simultaneous observation of various facts connected with the physical geography of the Central Sahara. A map of the proposed interior sea of the Sahara has also been prepared, and the Trans-Sahara Railway is spoken of as more than a probability. But we very much doubt if this can ever be a success. If it connected flourishing towns or portions of territory in which great cities are ever likely to be established, as in the case of the new American railways, there would be some hope for it. As it is, however over-populated the world may become, there is no likelihood of the formation of settlements in the heart of an unhealthy tropical region.

G. F. RODWELL

MR. DARWIN ON VIVISECTION

FROM the *Times* we reproduce the following letter addressed by Mr. Darwin to Prof. Holmgren of Upsala, in answer to a request for an expression of his opinion on the question of the right to make experiments on living animals for scientific purposes—a question which is now being much discussed in Sweden:—

"Down, Beckenham, April 14, 1881

"Dear Sir,—In answer to your courteous letter of April 7 I have no objection to express my opinion with respect to the right of experimenting on living animals. I use this latter expression as more correct and comprehensive than that of vivisection. You are at liberty to make any use of this letter which you may think fit, but if published I should wish the whole to appear. I have all my life been a strong advocate for humanity to animals, and have done what I could in my writings to enforce this duty. Several years ago, when the agitation against physiologists commenced in England, it was asserted that inhumanity was here practised and useless suffering caused to animals; and I was led to think that it might be advisable to have an Act of Parliament on the subject. I then took an active part in trying to get a Bill passed, such as would have removed all just cause of complaint, and at the same time have left physiologists free to pursue their researches—a Bill very different from the Act which has since been passed. It is right to add that the investigation of the matter by a Royal Commission proved that the accusations made against our English physiologists were false. From all that I have heard however I fear that in some parts of Europe little regard is paid to the sufferings of animals, and if this be the case I should be glad to hear of legislation against inhumanity in any such country. On the other hand I know that physiology cannot possibly progress except by means of experiments on living animals, and I feel the deepest conviction that he who retards the progress of physiology commits a crime against mankind. Any one who remembers, as I can, the state of this science half a century ago must admit that it has made immense progress, and it is now progressing at an ever-increasing rate.

"What improvements in medical practice may be directly attributed to physiological research is a question which can be properly discussed only by those physiologists and medical practitioners who have studied the history of their subjects; but, as far as I can learn, the benefits are already great. However this may be, no one, unless he is grossly ignorant of what science has done for mankind, can entertain any doubt of the incalculable benefits which will hereafter be derived from physiology, not only by man, but by the lower animals. Look, for instance, at Pasteur's results in modifying the germs of the most malignant diseases, from which, as it so happens, animals will in the first place receive more relief than man. Let it be remembered how many lives and what a fearful amount of suffering have been saved by the knowledge gained of parasitic worms through the experiments of Virchow and others on living animals. In the future every one will be astonished at the ingratitude shown, at least in England, to these benefactors of mankind. As for myself, permit me to assure you that I honour, and shall always honour, every one who advances the noble science of physiology.

"Dear sir, yours faithfully,

"CHARLES DARWIN

"To Prof. Holmgren"

THE MAGNETIC SURVEY OF MISSOURI

IN the summer of 1878 the writer began a magnetic survey of the State of Missouri. The work of the first summer was confined to the north-east part of the State, and no points of interest were brought out. During the summer of 1879 the work was extended over the western half of the State, and it was made apparent that diversity of surface exerted a much more important influence than had been suspected. The lines of equal declination were found to bend very sharply upon entering the large valleys, and the needle showed a *tendency* to set at right angles to the valleys. This tendency seemed to be greatest when the general direction of the valley made an angle of 45° with the *normal* position of the needle, or roughly, when the valley runs north-east and south-west, or north-west and south-east. This tendency seems to be inappreciable when the valleys run north and south, or east and west.

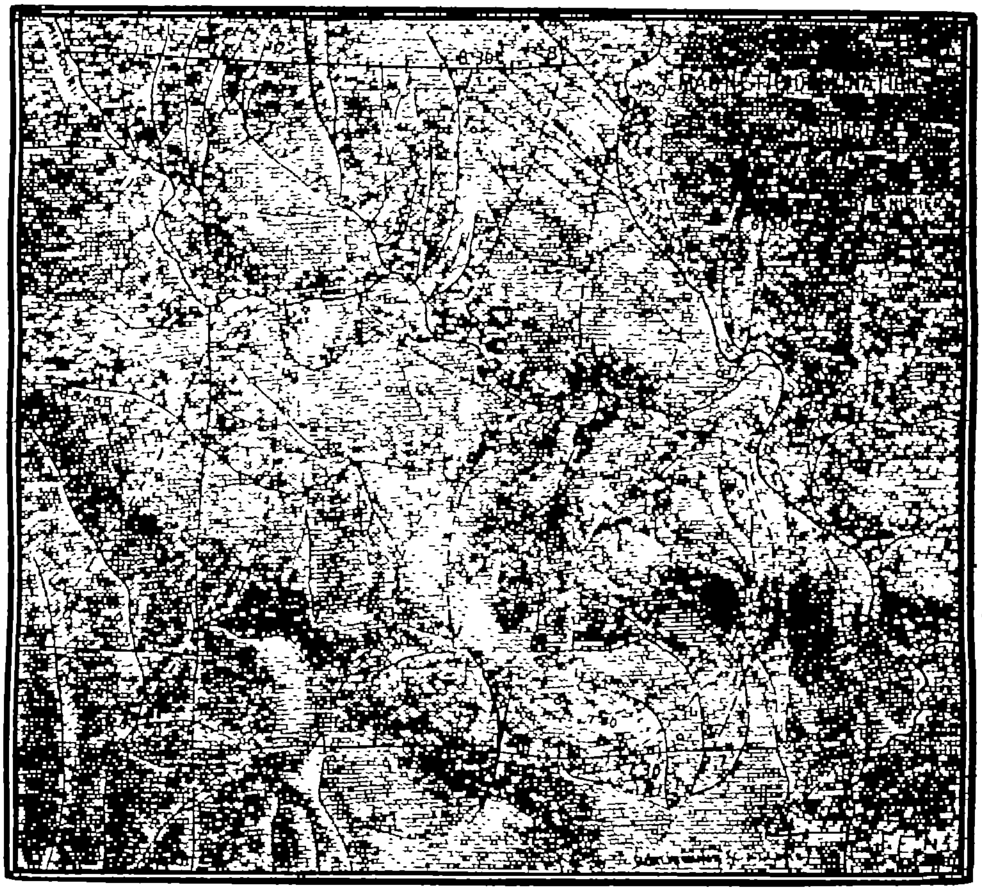
In the report of 1878 (*Trans.* St. Louis Acad. of Sc., vol. iv. No. 1, p. 143) it was suggested that this might result from the bending of the stream-lines of the earth-current sheet, due to the greater conducting power of the moist valleys. In order to settle this point, further examination is necessary, and it is proposed to determine the earth-currents at a number of properly selected stations.

During the summer of 1880 the work extended over the south-eastern part of the State, where still more important flexures of the isogonic lines were discovered. Here, however, the position of the needle is probably affected by the iron deposits, and the effect of contour is studied to less advantage. At the close of 1880 observations had been made at forty-five stations. In order to bring out the effect of contour, a relief map of the State was constructed in wax, and was finally reproduced in plaster. In this work use was made of the profiles of all the railroads in the State, together with a list of over 300 elevations in the State, collected by Gannett. The isogonic lines, which were first drawn upon an ordinary map, in the usual manner, to represent the observations thus far made, were then copied upon the relief map. In doing this it became apparent at once that the forty-five stations were wholly inadequate, and that the isogonic lines thus drawn are probably deserving of about the same weight that a topographical map would deserve if constructed from elevations at these stations.

The Chart is made after an artotype, which will accompany the third annual report in No. 2, vol. iv. *Trans.* St. Louis Academy of Science. In the original map the horizontal scale is twenty miles to the inch, the elevations being exaggerated 200 times. This exaggeration was necessary in order to bring out the form in the photograph, since on a relief map, 150 feet square, the greatest difference in elevation in the State would be represented by a vertical height of one inch. The horizontal scale of the cut is sixty-two miles to the inch.

The map represents only the grand outlines of surface as obtained from railroad profiles, and barometrical measurements. The dotted lines on the map are lines of equal variation of the magnetic needle: thus, on every part of the line marked 8°, the needle points 8° east of north, &c. These lines are drawn to represent the observations already made, and show in a general way the variation of the needle in the State. The map also shows that there is a marked relation between the direction of these lines and the contour of the surface. It cannot be said that it shows what this relation is, but it is probably due largely to the deflection of the stream lines of the earth current sheet, caused by unequal conducting power. This explanation necessitates the existence of looped areas in certain regions in the State, the existence of which is already indicated by the determinations. The loop in the 7° 30′ line, with its inclosed minimum, is probably complicated with the iron deposits in that region of the State.

Three stations in the Missouri valley have been inadvertently omitted in the cut. One of these (Corrollton) lies on the 8° 30′ line, a few miles north of the river. Another (Glasgow) lies on the river a little south of east from Corrollton. The third (Columbia) lies just east of the 8° line, and about south-east from Corrollton. A fourth station omitted, is nearly due east of the southern terminus of the 8° line, and just outside the 7° 30′ loop. The other stations, represented by the small circles, are shown on the cut, and an inspection of the map will show the weight to be given to different parts of these lines. At stations situated at points of abrupt curvature of the lines, the observations have been repeated at various localities in the region, until it was clear that no minute local effects existed.



The value in the Iron Mountain region is the mean of many hundreds of determinations made with a solar compass by Pumpelly and Moore in 1872. This region is in the east part of the 7° 30′ loop. In the western iron-field, which is nearly coincident with the 7° oval, our observations were repeated at various points (the aim being to *avoid* iron deposits) without finding any local action.

In conducting the survey, a magnetometer belonging to Washington University was used, but the dip circle and declinometer were kindly furnished by Prof. J. E. Hilgard of the U.S. Coast and Geodetic Survey. Thus far the survey has been conducted wholly on private means, in which we have been aided by the railroad companies, and by citizens of St. Louis. A Bill providing for the completion of the survey is now before the Legislature of the State.

FRANCIS E. NIPHER

PRIMITIVE MARRIAGE CUSTOMS[1]

THE chief object of Mr. Fison's recently published memoir on Kamilaroi marriage, descent, and relationship, is "to trace the formation of the exogamous intermarrying divisions which have been found among so many savage and barbaric tribes of the present day," and to show that what Mr. Morgan calls the punaluan family, with the "Turanian" system of kinship, logically results from them. His coadjutor, Mr. Howitt, though he has had some interesting information to give about the Kurnai tribes of Gippsland, has had the same chief object; so that the work the two have produced is much more a polemic on behalf of Mr. Morgan than a record of new Australian facts. We must begin, then, by stating what Mr. Morgan's theories are (so far as the work before us is concerned with them), and indicating, and estimating the value of, the evidence on which they rest.

---

[1] "Kamilaroi and Kurnai: Group Marriage, and Relationship, and Marriage by Elopement; also the Kurnai Tribe, their Customs in Peace and War." By Lorimer Fison, M.A., and A. W. Howitt, F.G.S. With an Introduction by Lewis H. Morgan, LL.D. (George Robertson: Melbourne, 1880.)

Mr. Morgan, having collected a great mass of facts concerning the terms in use between relations and connections throughout the world, and having found that those terms were, broadly speaking, divided into three orders, proceeded to spell out of the two earlier orders (the third consists of the modern terms of consanguinity and affinity) the whole of the early history of marriage and of the family. In what he has called the Malayan system of relationships, parent and child, grand-parent and grandchild, and brother and sister (or rather elder brother, younger brother, elder sister, younger sister, for there are no words for brother and sister) are the only terms in use; and one or other of these terms is used in addressing a person, according as the person addressed is of the speaker's generation or of the generation above, or of that below it. They are the terms always used when persons address one another, there being among those who use the system an invincible objection to the mention of their personal names. Mr. Morgan assumed that those terms were expressive of consanguinity and affinity; and conjectured that when first used they accurately described the relationships at the time existing, "as near as the parentage of children could be known." And it appeared to him that if there were a body of men and a body of women in the same tribe who all regarded each other as brothers and sisters, and all the men married all the women in a group, there would exist a marriage and family system which would explain the Malayan terms—the relationships arising out of which, so far as they were ascertainable, "as near as the parentage of children could be known," those terms would accurately express.

Accordingly, he framed the hypothesis that the first stage of marriage was the marriage in a group of men and women of the same blood calling themselves brothers and sisters. The family founded upon this kind of marriage he has named the consanguine family, and he regards it as the earliest form of the family. He does not say that such a system of marriage, or such a family system as he has supposed, has been found at any time anywhere; what he says is that this supposition of his explains the origin of the Malayan terms, and that nothing else can explain them. But does it explain them? It is at once obvious that there is one term, and that the most important of all, the use of which Mr. Morgan's hypothesis does not account for. Paternity may be doubtful—and if it were thought of at all in a group such as Mr. Morgan has conceived of, any man of the group might have as good a right as any other to be called father of any child born within it. But there can be no doubt about a man's relationship to his mother. In the case of mother and child the parentage is known with certainty, and therefore, on Mr. Morgan's hypothesis, a man should in the Malayan system have had only one mother. Now that system applies the term for mother to many women besides the actual mother—mother's sisters, father's sisters, uncle's wives, and so on, if not indeed to all women of the mother's generation. Here then the hypothesis breaks down; and the point at which we find it breaking down is really the only point at which it can be tested. The relationship between mother and child, too, which is confused or ignored in the Malayan system, is the one relationship of which it can be said with confidence that no system really founded on relationship could fail to recognise it. The explanation Mr. Morgan offers is that in the Malayan system the relationship of stepmother "is not discriminated," and there being no name for stepmother, stepmothers had to be called mothers, because "otherwise they would fall without the system." And he has what may be called a subsidiary hypothesis to account for there having been no discrimination between stepmother and mother. It is that the affiliation of children to the groups of men and of women to which they belonged would be so strong "that the distinction between relationships by blood and by affinity would not be recognised in every case." The fact of motherhood would be made little of, that is—there would be no discrimination between stepmother and mother—because the whole group would be, by a child, regarded as its mother. But this is equivalent to saying that, from the nature of the case, it was not to be expected that note should be taken of the relationships that could be known; and that is to abandon the hypothesis—as well as to deny us all chance of judging whether it is a good or a bad one. Possibly explanations of the failure of his hypothesis, such as Mr. Morgan suggests, might have some weight were he accounting for the Malayan terms as terms of address; but he takes them to denote actual relationships "as near as the parentage of children could be known." And no explanations can get over the fact that the Malayan terms are equally extensive in their application where, in the consanguine family, parentage would be known with certainty, and where it would not be known at all. The consanguine family is clearly a bad hypothesis. It might be thought it would hardly seem to anybody a plausible one; but Mr. Morgan always speaks of it as if it were among the best vouched of historical facts; and we are bound to say that Mr. Howitt believes in it as implicitly as Mr. Morgan.

To show the hypothesis of the consanguine family to be unstateable is to undermine Mr. Morgan's whole history of marriage and of the family. But Mr. Morgan has propounded a hypothesis as to the second form of marriage and the second form of the family, and as it is at this point that Mr. Fison (who does not quite believe in the consanguine family) lends him his advocacy, it is indispensable that we should give some account of it. Punaluan marriage, upon which was founded the punaluan family, was introduced by some reformatory movement, according to Mr. Morgan, to put a stop to the evils attendant upon brother and sister marriages. It existed in two forms. In one form of it a group of men, brothers or reputed brothers, had in common their wives who were not their sisters and not the sisters of each other; in the other form, a group of women, sisters or reputed sisters, lived in common with husbands who were not their brothers and not the brothers of each other. Punaluan marriage has not been observed at any time anywhere any more than the consanguine family; but Mr. Morgan believes that, in both its forms, it has existed everywhere, and probably during many ages. A correspondent wrote to Mr. Morgan stating that in the Sandwich Islands men whose wives were sisters and women whose husbands were brothers called each other punalua, which meant dear friend or intimate companion. And possibly drawing his bow at a venture, "the relationship," he said, "is rather amphibious. It arose from the fact that two or more brothers with their wives, or two or more sisters with their husbands, were inclined to possess each other in common." Whether conjecture or fact, this amounts to very little; but it was this which gave Mr. Morgan the suggestion of punaluan marriage. For proof of his hypothesis he again relied upon the terms he had collected—and at first upon its fitness to explain those same Malayan terms which, as we have seen, have more than enough to do to bear the weight of the consanguine family. In his latest work ("Ancient Society") he holds it to be proved by a nomenclature considerably different from the Malayan—his second order of terms which he has named the Turanian system of relationships. He regards the terms in this system also as accurately describing, "as near as the parentage of children could be known," the relationships existing at the time when they came into use. It differs from the Malayan in including words for cousin, uncle and aunt, and nephew and niece—or words which Mr. Morgan has so translated. It will be found, however, that Mr. Morgan does not use the punaluan family in accounting for any one of the Turanian terms. Those of them which coincide, or partly coincide, with the Malayan terms he had already accounted for by the hypothesis of the consanguine family, and he does this over again; the others he accounts for, or tries to account for ("Ancient Society," pp. 442–445), by means of exogamy alone. His reasoning is exactly what it would have been had the punaluan family never occurred to him. Indeed it has been an embarrassment to him; he has had to keep it out of his reasonings. For the punaluan family is, *ex hypothesi*, in two forms, and neither form could, "as near as the parentage of children could be known," yield both the Turanian sense of father and the Turanian sense of mother. Where the husbands were punalua, Mr. Morgan's reasoning would make them all, though not brothers, fathers of children born within the group, and it would exclude their brothers from being considered fathers. But, in the Turanian system, a father's brothers are called fathers. Similarly where the wives were punalua, Mr. Morgan's reasoning would make them, though not sisters, all mothers of the children of each of them, and would exclude their sisters from being considered as mothers. But, in the Turanian system, a mother's sisters are called mothers. Mr. Morgan has not failed to see this, and he has actually again framed a subsidiary hypothesis to give his hypothesis of the punaluan family a chance of living. This is (see "Ancient Society," p. 445) that where a group of sisters married men who were not brothers, they also became the wives of all the brothers "own and collateral"—that is, all the brothers and one-half of the cousins, however far removed—of each of their husbands; and, similarly, that when a group of brothers married women who were not their sisters, they also became the husbands of all the sisters and one-half of the cousins of each of their wives. All that need be said of this subsidiary hypothesis is that it gives quite a new look to the punaluan family—and that the effect of it, like that of the secondary hypothesis formerly noticed, is to deny us all chance of judging whether the principal hypothesis is a good or a bad one. The justification offered for it is that "the system (the Turanian) treats all brothers, as the husbands of each other's wives, and all sisters as the wives of each other's husbands, and as intermarried in a group"—but that is equivalent to saying that the system has taken no impression of the punaluan family, and gives no countenance to Mr. Morgan's hypothesis. As, apart from "the system," he finds nothing to say for it, it is difficult to see how any one can resist the conclusion that that hypothesis must be dismissed, and that it must be ranked among the wildest chimeras that have ever possessed the brain of a man of science.

Now, do Mr. Fison and Mr. Howitt give in any degree to Mr. Morgan's hypotheses the support of which they are in need? The answer must be no—and must be no even if we receive as facts the assumptions as to fact from which they set out. Mr. Howitt accepts both the consanguine family and the punaluan family, while Mr. Fison offers himself as the advocate of the latter only. But Mr. Howitt has nothing new to say for the consanguine family; he believes in it, and argues from it as if it were known historical fact—that is all; and so of it no more need be said. What then do his colleague and he find to say for the punaluan family? Literally, not a word. Mr. Howitt simply takes it for granted as he does the consanguine family. Mr. Fison, in beginning, undertakes to show that it results logically from his hypothesis—for it is no more than that—of "exogamous intermarrying divisions," but he does not attempt to do so. And, in fact, his "intermarrying divisions" are quite different from the punaluan family, and leave no need for it, and no room for it; that is, his hypothesis is different from and exclusive of Mr. Morgan's. In Mr. Fison's hypothesis, a group of men who are considered brothers and a group of women who are considered sisters—being the men and women of the same generation in two divisions which intermarry with each other, and only with each other—are by birth husbands and wives to each other; whereas, in the punaluan family, when the husbands are brothers the wives are not sisters—they are punalua; and when the wives are sisters the husbands are not brothers—they are punalua. Men who are brothers are restricted to women who are each other's sisters, on Mr. Fison's hypothesis; but, on Mr. Morgan's, men who are brothers marry women who, as a rule, are not each other's sisters. The marriage law shown in Mr. Fison's hypothesis would have to be given up before the punaluan family could have a chance of issuing out of the intermarrying divisions. Then, as Mr. Fison justly observes, his intermarrying divisions "would have precisely the reformatory effect" which Mr. Morgan attributes to the punaluan family—so that, given the divisions, the punaluan family would not be needed for reformatory purposes; and as Mr. Fison's view is that the totem clan grew up within his divisions, while their marriage law still subsisted, the punaluan family would not be needed to give birth to the clan (which Mr. Morgan says it has done). And, clearly, there would be no more room than need for it. It thus appears that, instead of supporting the hypothesis of the punaluan family, Mr. Fison has put it aside, and offers an improved hypothesis (suggested, no doubt, by Mr. Morgan's) in place of it. We have seen that he does not accept the consanguine family either. He does not, indeed, repudiate it. But to connect it with his intermarrying divisions seems to him so difficult that he thinks the one could have been changed into the other only through the intervention of "a higher power." He is not afraid of the ridicule to which he might be exposed were he to account for the first formation of the divisions by such a hypothesis; but he thinks it unnecessary to go behind them. We have now shown in what manner Mr. Fison supports Mr. Morgan—and we have shown that Mr. Morgan is in no position to give any support or countenance to him.

To show that the Turanian terms would result logically from his own hypothesis is what Mr. Fison has attempted. There are in a tribe two divisions which do not permit marriage within the division, and are restricted to intermarrying with one another. All the men in one division are the husbands of all the women of the same generation in the other; the wife does not come into the husband's division; and descent is reckoned through the mother. The group of men marries the group of women; and it is the group that is husband, the group that is wife, the group that is father, mother, son, or nephew; every person in it taking, however, all the relationships that arise to it. Such is the hypothesis. Seeing that the relationships are called group relationships, it might be thought that Mr. Fison considered the Turanian terms to have been, in the first instance, something other than terms of blood-relationship, say terms of address; but he denies that they are terms of address, and regards them as having been real relationships from the first. In what natural sense of relationship, however, a group—or the women in it other than the actual mother—can be mother of a child he does not tell us; and till he can make this plain, his theory must be held to be as untenable as the hypothesis of the consanguine family. As for his demonstrations (Q.E.D. at the end of each) of the Turanian terms, we can scarcely pretend to follow them. The terms which are specially Turanian are laid down by him in definitions, and these definitions are used in the demonstrations—so that, so far as these terms are concerned, he seems to assume what he is going to prove. On p. 87 (Prop. 12) he proves that certain groups are cousins by the mere statement of three definitions. What is also odd is that, immediately after, he proves, by a process of reasoning, that the same groups are not cousins, but brothers and sisters-in-law. Similarly, he proves first that a group is another group's nephew, and then that it is its son-in-law. This brings us to say that the terms which Mr. Morgan has translated uncle, aunt, nephew, niece, and cousin, and which he regards as denoting relationships, according to Mr. Fison really mean father and mother-in-law, and brother and sister-in-law only, and express nothing except that a person is called father or mother, brother or sister, as the case may be, by a man or woman whom one is free to marry. How these could, with group marriage, be more than terms of address it puzzles us to see. What it is necessary to notice in these demonstrations, however—and nothing else is really necessary—is that while by hypothesis descent is reckoned through the mother—which must show that relationship had to some extent been the subject of thought—and "so far as descent is concerned, the father is a mere nonentity," they all proceed on the view that the father, who on the hypothesis would be in each particular case unknown, is as much a relative as the mother. Having said this, no more need be said of Mr. Fison's demonstrations. It should be added, however, that the terms in use among relatives in Australia are, so far as Mr. Fison can learn, in the main Malayan—and he has no theory to account for the Malayan terms. He knows nothing at all of the terms in use among the Kamilaroi. He has himself found the native terms "exasperatingly puzzling." Several terms may be used by the same people for one relationship, and, as he says, matters other than relationship appear to be taken into account. The ceremony of initiation, for example, affects the words by which a man will designate another, though, as Mr. Fison says, it "does not touch their relationship."

As to the hypothesis itself, an essential part of it (and indeed of Mr. Morgan's hypotheses too) is that, as regards the intercourse of the sexes, there should have been no mixing of generations—that only men and women of the same generation should have been husbands and wives. A generation, apart from particular families, can be defined only loosely, but for Mr. Fison's purposes it should be definable with some precision. At any rate, his theory requires that the elderly men should have been kept separate from the young women, and the young men from the old women. But what an assumption this is—especially to make primarily of Australian natives, of whom nothing is better known than that the elderly men monopolise the women, and especially the young ones, and that a young man (though much license is allowed) hardly ever gets a wife, unless it be an old one, except by running away with her. This assumption, experience being dead against it, is of itself enough to put out of the field the hypothesis of which it forms a part. The idea of intermarrying divisions with groups of husbands all brothers, and groups of wives all sisters, no doubt sprang out of the hypotheses of Mr. Morgan, but apart from Mr. Morgan, it has a history which must be told. Briefly, it was suggested by a traveller's mistake.

In 1853 the Rev. William Ridley, a Presbyterian clergyman of Sydney, published a statement as to the marriage rules of the Kamilaroi, which statement is now known, on Mr. Ridley's own authority, to have been essentially erroneous. Mr. Fison still treats it as entirely true, and treats all later and more correct information as if it gave facts of a later order. Mr. Ridley said that the Kamilaroi were divided into four castes of men and four of women, and that (with one exception) the men of a caste could marry only women of one other caste. Murri, feminine mata; kubbi, feminine kubbitha; kumbo, feminine butha; and ipai, feminine ipata were the castes; and he said that a murri could marry a butha and no other woman, and that his children were not murri and butha, but ipai and ipata; and that, similarly, a kubbi could marry only an ipata, his children being kumbo and butha; and a kumbo only a mata, his children being kubbi and kubbitha; while an ipai, besides being free to marry any kubbitha, could marry any ipata not of his own family—his children, when he married a kubbitha, being murri and mata, and when he married an ipata, kumbo and butha. Mr. Ridley repeated this statement without change in 1855, and he told it in 1871 to Mr. Fison with this amount of change, that instead of castes he now spoke of classes (in unhappy imitation of Mr. Morgan), and of four classes, with men and women in each, instead of four classes of men and four of women; and that he described the marriage of ipai with ipata (that is with a woman of his own class) as an infringement of rule—changes that may fairly be ascribed to the initiative of Mr. Fison. Mr. Fison, putting aside the marriage of ipai with a woman of his own class as an irregularity, and idealising Mr. Ridley's statement, at once formed the hypothesis that all the men of one class originally were by birth the husbands of all the women of the same generation in the class with which they might intermarry. This, although he knew from Mr. Ridley that polygamy was largely practised among the Kamilaroi. Much licence was allowed; and the only word for spouse signified a person whom one is free to marry; and these two facts seemed to him to override Kamilaroi practice, and to prove that marriage had been communal, to begin. In the same year (1871), however, Mr. Ridley was again among the Kamilaroi, and sent to Mr. Fison a statement which should have shaken his faith in his hypothesis—both because of the new matter it contained, and because there were in it what he himself perceived to be errors of observation. Mr. Ridley has published several statements since, all containing obvious errors of observation or slips of memory, and it is impossible to receive even his latest statement as final. But observe what his latest statement is, and compare it with Mr. Fison's hypothesis. It is that the Kamilaroi are divided into totem clans (iguanas, paddy-melons, opossums, emus, blacksnakes, bandicoots); that every native has three names—a personal name (carefully concealed), a "class" name, and a totem name; that children take both the class name and the totem name through the mother; that the men and women of every class are free to marry one another, provided they are not of the same totem—and that, besides, murri may marry any butha, kubbi any ipata, kumbo any mata, and ipai any kubbitha. If his statements can be trusted, murri and butha, kubbi and ipata, kumbo and mata, and ipai and kubbitha, who are free to marry one another, are never of the same totem—so that all the marriages which certainly are permitted are marriages between persons of different totems. Mr. Ridley still leaves each class restricted from intermarrying with two others. So much of his original statement he has not yet found to be wrong. But the class name does not prevent marriage within the class. The notion that the Kamilaroi were in intermarrying or husband and wife "castes" was certainly erroneous. Is it likely then that the class-name is any bar to marriage outside the class? Is it not far more likely that there is still something for Mr. Ridley or some other inquirer to find out, and that, in the main, identity of totem is the *only bar to* marriage? We say in the main, because it is very likely that there are also regulations to prevent marriage between persons near in blood who are of different totems. Mr. Lance, who is a great authority with Mr. Fison, and who was Mr. Ridley's first informant, had got into his head that the Kamilaroi were divided by their names into castes with the marriage law which Mr. Ridley first described, and, meeting with an ipai whose wife was an ipata, he regarded him as a daring transgressor of the customary rule. The man told him that he and his wife were free to marry because they were not of the same mudji (totem); and, thereupon, Mr. Lance (who evidently had never before heard of totems) told Mr. Ridley that the ipai were privileged above their neighbours in being free to marry women of their own class who were not of the same family with them; and Mr. Ridley told the world that they were the aristocratic caste among the Kamilaroi. (He has since stated that the murri are the aristocratic class.) This is the sort of observation we are questioning. Had Mr. Lance seen in operation a rule intended to prevent, say a man from marrying his own daughter, he might easily have magnified it into a rule prohibiting two whole "castes" from marrying. And in all probability it was something like this he did. It is the ludicrously wrong impression he had before he met the ipai aforesaid that Mr. Fison has taken for the basis of his hypothesis—but from even that to the hypothesis is a tremendous jump. And, after all, even if we overlook the inadmissible assumption which forms an essential part of the hypothesis, it appears not to be good for anything.

What have been called caste or class names appear, so far as the evidence goes at present, to be names merely, and to have no effect on the right of intermarriage. The system of naming is certainly very peculiar. The names alternate in successive generations. That is not in itself peculiar; but the same name is taken by all the sons, the same name by all the daughters. Thus ipata's children are the sons all kumbo, and the daughters all butha; and, again, butha's children are ipai and ipata. It is a pretty widely spread system. Mr. Howitt says that, as far as he knows, it prevails among all Australian tribes; but this is going a vast deal too far; and is calculated to undermine faith in Mr. Howitt's judgment, for it plainly does not prevail among the Kurnai whom he himself has described. His report shows nothing like castes or classes among them; the men, he says, are all called yeerung (emu-wren) by the women, and the women all djeetgun (superb-warbler) by the men; but this (whatever it may mean, and it may mean very little) does not divide the Kurnai into anything other than men and women. Mr. Fison has had from a number of correspondents statements which he takes to mean that among tribes other than the Kamilaroi which have this system of naming, there is no marriage between persons of the same name; but his correspondents are neither, as regards opportunity or observing power, above Mr. Lance; and Mr. Ridley's study of the Kamilaroi, imperfect as it has been, gives the only evidence that can be regarded as trustworthy. Mr. Fison has amended the list of marriages allowed among the Kamilaroi, given by Mr. Ridley, as he says, on later information; but anonymous information cannot be thought of much value on this matter as against the authority of Mr. Ridley. Mr. Fison is too easily satisfied with anything that seems to make for his view to be blindly trusted in such a matter. We find him inferring from there being no marriage between blood-relations—which may mean totem clans—among people who have the class names that there is no marriage within the class. We find totem clans, too, reported to him as classes and ranked by him as classes; and "divisions," which probably mean totem clans, are also ranked by him as classes. On the other hand he candidly gives at least one case in which the class-names are said not to restrict marriage. He gives at the very beginning of his book a native legend of brothers and sisters having married at the first—a legend which both Mr. Morgan and he make much of. We are surprised, however, at his missing the true point of it. What it exhibits is not a movement to "intermarrying divisions" or classes, but to the establishment of totem clans. *These* are all the natives seem to have thought in need of explanation.

We should have been glad to notice Mr. Howitt's account of the Kurnai at some length, but we must be brief. The Kurnai have kinship through males and exogamy—that is, prohibition of marriage within the kindred; and as was to be expected in such a case, the kindreds form local tribes. He does not expressly tell us whether or not these clans or local tribes are distinguished by totems (which shows that he meant to be careful, and that his information was very far from being complete), but incidentally he lets out that they are. When a Kurnai young woman meets a young fellow who, being a stranger, looks as if he might make a husband for her, Do you eat kangaroo, opossum, blacksnake? is her first question after saluting him. Presumably the animal she names is her own totem. If the stranger may eat it he can marry her. As for his discovery of marriage by elopement, we have no doubt that it is (as a missionary friend of his, Mr. Bulmer, hinted to him it must be) a mere product of misconception. Young men among the Kurnai, he says, could get wives only by eloping with them on the proposal of the women. This may be; an Australian young man could scarcely ever get a wife except by running away with her. But how did the elderly men get their wives? He appears never to have asked that. But he is aware that there was a system of exchanges. The Kurnai are polygamous, and no doubt among them, as among other Australians, the elderly men had, by means of exchanges, nearly all the young women for wives. Mr. Howitt writes so candidly, and his account of the Kurnai is in many respects so interesting, that we should gladly have brought ourselves to think better of this discovery of his. But after reading Mr. Fison's most amazing account of the origin of marriage by elopement, we find ourselves shut up to holding that it is simply a big blunder. Nothing else could have elicited so preposterous an explanation. But such words as preposterous fall harshly on the ear, and we would part from our authors without unkindness. Their exertions to advance a growing science are truly commendable. If the result has been rather to mystify than to elucidate, there is but one more illustration of the way in which good intentions, industry, and ingenuity are wasted when men have started in the wrong track.

D. MACLENNAN

NOTES

THE evening discourses at the meeting of the British Association at York will be delivered by Prof. Huxley and Mr. Spottiswoode. Mr. Huxley will speak of the "Rise and Progress of Palæontology" on Friday, September 2, and Mr. Spottiswoode "On the Electric Discharge, its Forms and its Functions," on Monday, September 5.

THE Honorary Fellowship of the Royal College of Surgeons in Ireland was on Wednesday last week conferred on Prof. Helmholtz, and the Honorary Degree of LL.D. by the University of Dublin. On Monday night, at an ordinary meeting of the Royal Society of Edinburgh, Sir William Thomson in the chair, Prof. Helmholtz read a paper on "Electrolytic Conduction." There was a crowded attendance, and Prof. Helmholtz was warmly received.

ON Monday the National Fisheries Exhibition, which has been organised at Norwich under the care of numerous public bodies, from the Board of Trade downwards, was opened by the Prince and Princess of Wales. The exhibition is divided into six classes, as follows:—1. Pisciculture and shell-fish culture; 2. Models, trawling gear, drifting gear, canvas and ropes, and inland fishing tackle; 3. Life-saving apparatus, lamps, fog-horns, signalling, &c., architectural plans for fish markets, fish-curing establishments, fish vans, and fishermen's clothing; 4. Pictures, utilisation of condemned fish and fish refuse as a manure, and the cleansing of sewage-polluted streams; 5. Dried, salted, smoked, and tinned fish, shell fish, fish oils, manure, and disinfectants, aquatic flora and fauna, and birds which prey upon fish; 6. Loans. There is in the last class a fine collection of casts made by the late Frank Buckland, which has been lent by the authorities of South Kensington Museum. The exhibits of preserved specimens of aquatic, or rather fish-eating, birds is also highly interesting and instructive. In the class devoted to the culture of fish there are a large number of tanks, troughs, and the various appliances for hatching the ova of fish, for rearing the young fry, &c. There are also shown live fish in a series of aquaria, amongst which are specimens of nearly every variety of fresh-water fish indigenous to this country, the local fauna being especially complete. Next week we hope to give the address which Prof. Huxley, who is now one of the Inspectors of Fisheries, delivered in connection with the Exhibition.

From the *Sydney Morning Herald* we are glad to learn that a zoological station is at last to be established at Watson's Bay, under the direction of Baron N. de Miklouho-Maclay, on a small grant of land obtained from the Government. After a lengthy absence at the Melanesian Islands and in Queensland he has returned with the intention of remaining in Sydney until he can complete what he began in 1878, and see the zoological station firmly established. The land granted by the Government at Watson's Bay is situated near Camp Cove, and is about half an acre in extent. Upon this a cottage of five work-rooms will be erected, and this building will be for the use of naturalists who visit New South Wales for the purpose of studying the zoology and botany of Australia. The Government, understanding its scientific value, have given what assistance they can, and have promised that if 300*l*. be collected by private subscription a similar sum will be contributed towards the expense of erecting the building from the public revenue. The subscriptions up to the present amount to about 200*l*., and it is hoped there will be no difficulty in obtaining the balance which will be necessary for forming the zoological station on the small scale contemplated for a beginning. This station will be the first of the kind in the southern hemisphere, and will supply a serious want.

The death is announced, at the end of February last, of Mr. Gerard Krefft, the Australian naturalist. Mr. Krefft was born in Brunswick, Germany, in 1830, and early conceived a taste for natural history. After spending some time in the United States he went to Melbourne in November, 1852. Mr. Krefft was selected to accompany the collecting expedition fitted out by the Victorian Government, 1858. Having succeeded the leader in command of the party he returned to Melbourne with a large collection of specimens and a well-filled portfolio, and was engaged by Prof. M'Coy as assistant in the Museum. He gave a report in full about the animals obtained and an account of the manners and habits of the aboriginals, illustrated by numerous sketches. He then resigned his position and returned to Germany. In 1859 he again left home for foreign lands, having obtained from the Hamburg firm, Messrs. Godeffroy and Son, a free passage for a trip round the world, and after a two months' sojourn in South Africa he took up his quarters in Sydney, being appointed secretary to the Australian Museum and assistant to the late Dr. Pittard, its curator. On the death of that gentleman Mr. Krefft succeeded to the vacant curatorship in 1861. During the latter years of his appointment he had a series of disagreements with the trustees of the Museum, which resulted in his leaving that institution, September, 1874. Mr. Krefft was probably the first man who thoroughly studied the reptiles of Australia. Mr. Krefft was a F.L.S., C.M.Z.S., and Member of various other learned societies.

Among Mr. Murray's forthcoming works are the following:—"The Formation of Vegetable Mould through the Action of Worms, with Observations on their Habits," by Charles Darwin, F.R.S.; "The Life and Letters of the late Sir Charles Lyell, Bart.," edited by his sister-in-law, Mrs. Lyell; "The Land of the Midnight Sun," being a narrative of summer and winter journeys through Sweden, Norway, Lapland, and Northern Finland, by Paul B. du Chaillu, of gorilla fame; also a second and revised edition of Mr. W. H. White's "Manual of Naval Architecture."

At the meeting of the Sanitary Institute of Great Britain on April 13, Dr. Richardson read a paper of suggestions for the management of cases of small-pox and of other infectious diseases in the metropolis and large towns. Dr. Richardson maintains the thesis that there should be no aggregation of infectious cases in large central institutions, and describes the objections to such aggregation. He suggests further that the sanitary committee or authority in every parish should have al the special centres of infection in each of its districts thoroughly mapped out, and that it should know, on a calculation of cases occurring in quinquennial periods, what is the permanent accommodation required for its infectious sick. He urges that the required accommodation being known, the local authorities should keep ready at all times within the parish such necessary accommodation in small hospitals situated in different parts of the parish or locality. Dr. Richardson described what he thought should be the size, mode of construction, and position of such hospitals:—(*a*) That each hospital should not be larger than is sufficient to receive twenty-four persons at one time. (*b*) That each should be constructed on the separate system for the patients. (*c*) That each should be constructed of iron, so that it may at any time be absolutely purified by fire throughout all its structure. (*d*) That each should be placed on the upper storey of a building, forming in fact the top storey of one or more houses, so that it may be lighted and ventilated directly from its roof. (*e*) That all the air that passes out of the hospital when it is occupied by infectious persons should pass through fire. (*f*) That each patient should be carried into the hospital by a valved lift, which lift should pass through a shaft, so as to draw up air during its ascent, and which should, when required, be effective for flushing the hospital with air. Dr. Richardson entered into the subject of the organisation of these hospitals in respect to general supervision and nursing. Under this head he recommends—(*a*) That the general supervision should be in the hands of the Medical Officer of Health. (*b*) That the nursing, also under the supervision of the Medical Officer of Health, should be carried out by trained nurses, who might be educated to their work in the Union infirmaries. Lastly he suggested that the medical attendance should be conducted by a special staff of duly qualified medical men acting under the Medical Officer of Health and responsible to the local authority, by whom they should be approved and remunerated. An interesting discussion followed, which was adjourned to the 27th inst.

Under the auspices of the National Health Society the following Drawing-Room Lectures will be delivered at 23, Hertford Street, Mayfair (by kind permission of Mr. Charles Matthews), to commence at 4 o'clock p.m.:—Friday, April 22: Prof. Fleeming Jenkin, F.R.S., "Sanitary House Inspection"; Friday, April 29: Dr. Robert Farquharson, M.P. (formerly Medical Officer of Rugby School), "Health in Public Schools"; Friday, May 6: Mr. C. N. Cresswell, "Sanitary Relations of Local Self-Government"; Friday, May 13: Mr. Henry Power, M.B., F.R.C.S., "Care and Education of the Eye"; Friday, May 20: Dr. Siemens, F.R.S., LL.D., "Stoves and Grates"; Friday, May 27: Mr. Ernest Hart, M.R.C.S., "Recent Progress in Health Knowledge." Tickets may be obtained from the secretary at the offices of the Society, 44, Berners Street, on Mondays and Fridays from 2 to 5, or will be forwarded by post on application. Patronesses: H.R.H. Princess Christian; H.R.H. Princess Louise, Marchioness of Lorne; H.R.H. Princess Mary Adelaide, Duchess of Teck. The president of the Society is His Grace the Duke of Westminster, and the Chairman of Council, Mr. Ernest Hart, M.R.C.S. The objects of the Society are to diffuse sanitary knowledge in every possible way, by the delivery of simple practical lectures on air, ventilation, food, and cookery, the prevention of the spread of infectious disease, and kindred subjects, at working men's clubs, mothers' meetings, and elsewhere, in all parts of London and the suburbs; by the circulation of sanitary tracts and papers; by encouraging the teaching of the laws of health in high schools and Board schools, by offering prizes, &c., to both teachers and pupils; and to secure open spaces for the healthy recreation of the people. Membership is constituted by the payment of 1*l.* 1*s.* annually; life membership by the single payment of 10*l.* 10*s.* Communications to be addressed to Miss Lankester, the Secretary, at the offices of the Society, 44, Berners Street, Oxford Street. It is evident that this Society has adopted effectual means to do a good and highly necessary work; it deserves the heartiest support from all who can in any way lend a helping hand.

TWO Art Exhibitions were opened under the auspices of the Sunday Society on Easter Sunday, one at Whitechapel, the other in New Bond Street. That at the East-end consisted of a Loan Collection of Paintings, &c., organised by the Rev. S. A. Barnett, to which the Council on Education contributed largely from the National Collection at South Kensington. More than 2500 persons visited the Exhibition during the day, it being open from 2 till 9 p.m. The West-end Exhibition was the first Exhibition of the new Society of Painter-Etchers at the Hanover Gallery, and this was visited by about 578 members of the Sunday Society between the hours of 4 and 6.30 p.m. On Sunday, April 24, this Exhibition will be open to ticket-holders. Free tickets may be had by all who make a written application, inclosing a stamped and *addressed* envelope to Mr. Mark H. Judge, Hon. Sec. of the Sunday Society, 8, Park Place Villas, W.

THE second series of meetings organised by the Sunday Evening Association at the Neumeyer Hall was brought to a successful close on Easter Sunday by a lecture on "Lessing," by Mr. Moncure D. Conway. The hall was crowded, and at the close it was announced that the first annual meeting of the Association would be held in May, and that in the autumn the Committee intended to organise a series of meetings in the different Metropolitan suburbs, in order if possible to start local branches. The object of the Sunday Evening Association is to bring together all persons who, estimating highly the elevating influence of music and the sister arts, literature and science, desire by means of meetings on Sunday evenings to see them more fully identified with the religious life of the people. The subscription is 2*s.* 6*d.* per annum, which may be paid to the treasurer, Mr. Godfrey Shaen, 15, Upper Phillimore Gardens, W.

WE take the following from the *Electrician*:—The following correspondence over the telephone wires yesterday, says the Kansas City *Times*, is a further proof of the fact that no one but a bald-headed man could do without one:—"Hello, central!" "Hello!" "Connect me with the signal bureau." "All right—go ahead." "Hello, signal!" "Hello!" "Is it going to thaw to-day?" "Yes, there are indications." "How's the wind?" "Getting round to the south." "Do you think I can safely have my hair cut?" "Wait a minute until I consult the barometer, thermometer, and wind gauge." (Silence for half a minute.) "Hello!" "Hello!" "Yes, you can go ahead. There won't be any change to speak of for the next twelve hours. There is a cold wave moving up the Ohio River, and a snow-storm is reported at Cheyenne, but if I were you I'd take my chances on the hair-cutting." "All right—much obliged." "Good bye."

MR. PFOUNDES has reprinted, in a separate form, his short but interesting paper at the Anthropological Institute, on the "Japanese People: their Origin and the Race as it now exists."

THE usual meeting of delegates of the Sociétés Savantes takes place this week at the Sorbonne on a somewhat enlarged scale. It is the first time that members of Parisian societies will meet in combination with their provincial brethren.

A NEW fortnightly journal, *L'Electricien*, has appeared in Paris.

THE *Times'* Swiss correspondent states that the acclimatisation of the ibex in Switzerland would appear to be so far a success. The herd which was turned out some time ago in the Grisons is reported to have got through the winter without damage and as being at present in an excellent state of health.

A CORRESPONDENT of the *Daily News* points out that the exact time of the great Chios earthquake on the 3rd inst. was 1.50 p.m.

NO. 2 of vol. iii. of the *American Antiquarian and Oriental Journal* (Chicago, Jameson and Morse) contains several contributions relating to American archæology, especially on the mound-builders. The editor, the Rev. S. D. Peet, has an article on the military architecture of the emblematic mound-builders, and there are various other contributions from various parts of the States bearing on the life and works of the prehistoric peoples of America. In the Oriental department various interesting points connected with Eastern antiquities are discussed.

PROF. CORNELIUS DOELTER of Grätz has safely returned from his journey to West Africa. He has brought home mineralogical and ethnographical collections.

THE Report of the West Kent Natural History Society speaks of its continued prosperity. It contains an interesting address by the President, in which he points out certain important bearings of recent researches on light. Speaking of the Blackheath holes, the President is inclined to think they are over the sites of pockets or pipes in the chalk, and that the cause of the subsidence is the drawing away of the subsoil by the action of water, the subterranean drainage produced by the pumping up of the water by the Kent Water Works at Deptford, drawing away sand and chalk in mechanical suspension.

THE following are among the papers in the *Transactions* of the Cumberland Association, part v.:—"Distribution of Boulders in West Cumberland," by J. D. Kendall, F.G.S.; "Soul-Cells and Cell-Souls," from the German of Haeckel, by the Rev. C. H. Parez; "The Influence of Geological Structure on Scenery," by Mr. Kendall; "The Local Museum and its Relation to the Natural History of the District," by Mr. James Arlosh; "The Moths of the District," by Mr. George Dawson; "The Character and Distribution of the Diatomaceæ," by Mr. B. Taylor; "Notes on Inglewood Forest," by Mr. John Jackson.

AN Electric Railway is being laid down in the grounds of the Crystal Palace.

THE Academy of Natural Sciences of Philadelphia are giving Spring courses of instruction in Invertebrate Palæontology and Mineralogy.

THE additions to the Zoological Society's Gardens during the past week include a Common Rhea (*Rhea americana*) from South America, presented by Mr. A. D. M. Stewart; a Mountain Ka Ka (*Nestor notabilis*) from New Zealand, presented by Dr. A. de Lantour, M.R.C.S.; an Undulated Grass Parrakeet (*Melopsittacus undulatus*) from Australia, two Californian Quails (*Callipepla californica*) from California, two Common Quails (*Coturnix communis*), a Greenfinch (*Ligurinus chloris*), a Goldfinch (*Carduelis elegans*), two Chaffinches (*Fringilla cœlebs*), two Common Crossbills (*Loxia curvirostra*), a Common Lapwing (*Vanellus cristatus*), British, a Barred Dove (*Geopelia striata*), a Nutmeg Bird (*Munia undulata*) from India, two Rufous-necked Weaver Birds (*Hyphantornis textor*) from West Africa, two Mocoa Pigeons (*Columba œnas*, var.), from Tunis, presented by Mr. H. H. Johnston; a Green Turtle (*Chelone viridis*) from West Indies, presented by Mr. J. C. Robinson, R.M.S. *Dunrobin Castle*; a Common Viper (*Viper berus*), two Common Snakes (*Tropidonotus natrix*), British, presented by Mr. J. Poyer Poyer; a Red-faced Saki (*Brachyurus rubicundus*), a Horrid Rattlesnake (*Crotalus horridus*) from South America, a Brown Bear (*Ursus arctos*) from Spain, a Great Kangaroo (*Macropus giganteus*), two Ursine Dasyures (*Dasyurus ursinus*), three Vulpine Phalangers (*Phalangista vulpina*) from Australia, deposited; a Beisa Antelope (*Oryx beisa*), a Banded Ichneumon (*Herpestes fasciatus*), a Squirrel-like Phalanger (*Phalangista sciureus*), born in the Gardens.

OUR ASTRONOMICAL COLUMN

THE SOLAR PARALLAX.—M. Puiseux, in a communication to the Academy of Sciences of Paris, discusses the numerous micrometrical measures made during the last transit of Venus by MM. Mouchez and Turquet at St. Paul's, and MM. Fleuriais and Bellanger at Pekin. If these observations had possessed a high degree of precision he considers that they would have furnished a very exact value of the solar parallax, but unfortunately, so far at least as regards the measures at St. Paul's Island, the conditions were extremely unfavourable; indeed in a note which follows M. Puiseux's communication Admiral Mouchez remarks that the equatorials provided for that station had no special appliances for this class of observation, and worse still, "les observations ont été faites exactement au moment du passage du centre d'un violent cyclone, pendant la courte éclaircie qui accompagne la plus grande dépression barométrique." The instruments in fact were more particularly adapted to proposed observations of contacts, and were very weakly mounted; oscillations were occasioned by the violent wind, so that the practised observers had no confidence in their results. Notwithstanding these circumstances M. Puiseux has discussed the measures, and from the combination which he regards as the most favourable, where 81 observations that appear affected with considerable errors are rejected, leaving 312 measures for calculation, he deduces for the value of solar parallax 9″·05: the mean value of the corresponding residuals is 0″·78, and the extreme residuals − 1″·98 and + 2″·15. Considering that under such disadvantageous conditions the observations accord passably, M. Puiseux thinks there are reasonable grounds to expect that with firmly-mounted instruments micrometrical measures may be obtained at the approaching transit in 1882, which will furnish a pretty exact value of the sun's parallax.

THE DOUBLE-STAR HERSCHEL 3945.—The double-star to which Mr. Birmingham drew attention in NATURE last week on the score of contrasted colours of the components and variability of the principal star has a longer history than is noted in his letter. It is found as a single star of sixth magnitude in Bode's Catalogue, from his own observation, and is Canis Majoris 164. Lalande observed both components on March 2, 1798, magnitude 5 and 7. On January 23, 1835, Sir John Herschel, observing at the Cape, calls them 7 and 8, "large star orange; small, pale blue": and on January 31, 1837, he estimated the magnitudes the same: "large star, very high yellow; small, contrasted blue"; these observations occur in Sweeps 532 and 768. Amongst his micrometrical measures we find for the epoch 1837·153 magnitudes 6¼ and 7, and for 1837·301 magnitudes 6¼ and 8, with the note "Orange and green, fine contrast of colours." Next we have three meridian observations of the principal star by Argelander in vol. vi. of the "Bonn Observations," on January 26 and March 13 and 14, 1850, magnitudes noted, 5·5, 4·5, and 5·0, and one observation of the companion on March 23 in the preceding year, when it was estimated 7·5. In Heis and Argelander the naked-eye estimate is 5 m. The components are separately noted in Gould's *Uranometria Argentina* A. 5¼ red, B. 7. The star does not occur in D'Agelet, Taylor, or in Argelander's Southern Zones. The mean place for the beginning of the present year is in R.A. 7h. 11m. 31·80s., N.P.D. 113° 6′ 19″·4.

THE TOTAL SOLAR ECLIPSE OF 1878.—In one of the handsomely-executed volumes which issue from the Government Printing Office at Washington, the U.S. Naval Observatory has published the detailed reports of the various expeditions organised for the observation of the total eclipse of the sun on July 29, 1878, which possess a high degree of interest. A large number of wood-engravings and lithographic plates accompany the reports. There is also appended a brief account of the observations made in California during the total solar eclipse of January 11, 1880.

THE EARTHQUAKE OF NOVEMBER 28, 1880, IN SCOTLAND AND IRELAND[1]

THE data on which the paper has been founded have been collected from upwards of fifty stations, and special reliance may be placed on the results, as a large proportion of these stations were lighthouses, in each of which at the time of the occurrence there was a keeper *on watch*, the earthquake having occurred after sunset at a time when the lamps were lighted.

The paper at the outset gave the effects and nature of the shock experienced by various observers at those lighthouse stations where the disturbance was felt.

The data acquired were then discussed, and the following are the general conclusions arrived at:—

1. That the earthquake occurred in November, a month in which many of the British earthquakes are recorded as having happened.

2. That it occurred after a wet and stormy period, which had been preceded by an unusually dry summer and spring; that there was a widespread thunderstorm at the time, and that the barometer was rising slowly over the greater part of the west of Scotland; the average height of the barometer at the lighthouse stations at which the earthquake was felt being at 9 a.m. 29·4 inches, and at 9 p.m. 29·5 inches. The thermometer at 9 a.m. averaged 50° F., and at 9 p.m. 48° F.

3. That the seismal area was about 19,000 square geographical miles, the shock having been felt as far north as the Butt of Lewis, as far south as Armagh in Ireland, as far east as Blair Athole, and as far west as Barra Head Lighthouse, though how much farther it was propagated into the Atlantic it is impossible to say.

4. That the range of the earthquake or distance to which the wave was propagated was greater over the sea than over the land.

5. That the earthquake was not a simultaneous shake over the disturbed area, but was produced by a wave propagated from a centre.

6. That the undulation seems to have been chiefly of an "up and down" character like a wave of the sea, and that calculating the "breadth" from the mean velocity of transit and the minimum duration of the shock, the wave appears to have been fully 1100 feet "broad."

7. That the observations warrant the assumption that a spot near Phladda Lighthouse (north-east of Colonsay) was the source, and calculating the velocities of transit with a point 13 miles south-south-west of Phladda Lighthouse as a centre, it appears that the wave travelled with a greater velocity over the sea-basin than over the land, probably due to the fact that over the sea there was a thinner and lighter crust to throw into vibration; the average velocity on sea journeys being 6·74 geographical miles per minute, and the average velocity on land journeys 4·65 miles per minute, the mean of the whole being about 5¾ miles per minute.

8. That the source of the earthquake lay at or near the great

---

[1] By Charles Alex. Stevenson, B.Sc., Edinburgh, communicated to the Royal Society of Edinburgh by Prof. Geikie, F.R.S., March 21, 1881.

fracture of the earth's crust which runs in a south-westerly direction from Inverness.

9. That all the observers who heard the noise agree in stating that it was a "rumbling" sound.

10. That of the fourteen observers within 38 miles of the source who felt the shock, thirteen of them mention having heard the rumbling noise, and none of the other observers in Scotland mention noise as an accompaniment of the earthquake, and hence that the noise was confined chiefly, if not entirely, to places situated near the source.

11. That the stations where the noise was heard were for the most part situated on hard dense rocks, with little or no soil near them.

12. That the average duration of the disturbance was 4·4 seconds for observers situated within the sound area.

13. That of twenty-two lighthouse observers between Cape Wrath and the Mull of Galloway who were situated on the older formations (Laurentian, Cambrian, and metamorphosed Lower Silurian) eleven felt the shock, whilst of thirteen observers situated on newer rocks it made itself known only to two of them, and that the earthquake was therefore more generally felt on the older rocks of Scotland.

14. That stations situated near one another and on the same formation did not necessarily both receive the shock, and that faults and trap dykes did not seem to affect the passage or intensity of the wave in any way.

15. That the observations of time at Armagh, Belfast, and Omagh show that the shocks at these places were most probably propagated direct from Phladda in Scotland, and that the severity of the shock and the "rumbling" noises heard in and around Letterkenny were probably due to a second and local source of disturbance generated by the arrival of the shock from Phladda.

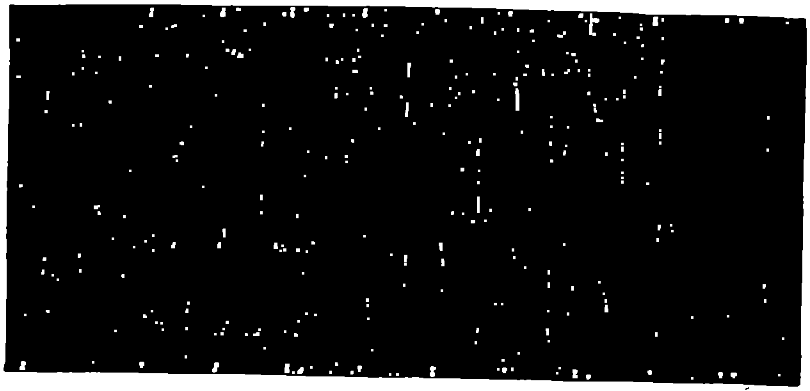
MAGNETIC DECLINATION[1]

1. It is well known that Prof. Rudolph Wolf has endeavoured to render observations of sun-spots made at different times, and by different observers, comparable with each other, and has thus formed a list exhibiting approximately the relative sun-spot activity for each year. This list extends back into the seventeenth century, and is unquestionably of much value. Nevertheless it must be borne in mind that we possess no sun-spot data sufficiently accurate for a discussion in a complete manner of questions relating to solar periodicity before the time when Schwabe had finally matured his system of solar observations, which was not until the year 1832.

We have however a much longer series of the diurnal ranges of magnetic declination. Now these are already well known to follow very closely all the variations of sun-spot frequency, being greatest when there are most, and least when there are fewest spots; and it may even be imagined that such ranges give us a better estimate of true solar activity than that which can be derived from the direct measurement of spotted areas.

The long-period inequalities of the diurnal range of magnetic declination are thus, we may imagine, precisely those of solar activity, so that to analyse the former is probably equivalent to analysing the latter.

2. Our method of analysis is not new. The system pursued by us is in fact that which has been pursued by Baxendell, and probably other astronomers, with observations of variable stars, and it has already been applied by one of us in a preliminary manner to magnetic declination ranges (*Proc.* Lit. and Phil. Society, Manchester, February 24, 1880).



3. The observations at our disposal are those which have been used by Prof. Elias Loomis in his comparison of the mean daily range of the magnetic declination with the extent of the black spots on the surface of the sun (*American Journal of Science and Arts*, vol. l., No. cxlix.). These observations are recorded as monthly means of diurnal declination range, and we found it necessary to multiply each by a certain factor, firstly, on account of the well-known annual inequality of declination range, and secondly, to bring them all to the standard of the Prague observations. We have applied for this latter purpose precisely the same corrections as those made by Prof. Loomis.

4. The result of an analysis of these observations has been to indicate the existence of three inequalities: two dominant ones with periods of about 10½ and 12 years, and a subsidiary one with a period of about 16¼ years. By these means we have been enabled to reproduce the observed annual values of declination range with an average difference of 39″. The amount of agreement between the observed and calculated values will be seen from a diagram which accompanies this note. We are however of opinion that the series of observed values at present obtainable is too short to render this analysis a very accurate one. It will certainly not bear carrying back forty or fifty years beyond its starting-point, which was in 1784, and it would be very hazardous to carry it forward any considerable length into the future. We may however mention that our calculations indicate a maximum of declination range about 1884, but not so pronounced a maximum as that of 1871.

5. During our analysis an observation was made by us which we think worthy of record.

It is a well-known fact that the so-called eleven-yearly oscillations of declination range are at certain times large, and at other times small. Thus, for instance, they have been large for the last forty years, but they were small about the earlier part of the present century. It is clear to us from an inspection of the observations that a series of large oscillations is accompanied with an exaltation of the base line, or line denoting average efficiency, while a series of small oscillations is accompanied with a depression of the same. The result is a long-period curve of the base line, the beat period, so to speak, of the eleven-yearly inequality.

Now a phenomenon precisely similar occurs in connection with shorter periods. If we take inequalities having a period of three or four months we find that such are alternately well developed or of large range, and badly developed, or of small range; and that a large range of such is accompanied with an exaltation of the base line or line of average efficiency, while a small range is accompanied with a depression of the same. The result is a curve of the base line, of which the period is, roughly speaking, eleven years. May we not therefore imagine that the so-called eleven-yearly period, or, to speak more correctly, the ten and a half and twelve-yearly periods into which the eleven-yearly period may perhaps be analysed, may be in reality beat periods for shorter disturbances? Is it not therefore possible that a study of these shorter periods may give us information regarding the nature of the eleven-yearly period, whether for sun-spots or declination ranges, which the small series of actual observations is incompetent to afford?

---

[1] "Note on an Attempt to Analyse the Recorded Diurnal Ranges of Magnetic Declination." By Balfour Stewart, M.A., LL.D., F.R.S., Professor of Natural Philosophy at the Owens College, and William Dodgson. Read at the Manchester Literary and Philosophical Society, March 8.

We beg to take this opportunity of thanking Mr. William Stroud for the help he has given us in this investigation.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

CAMBRIDGE.—At Trinity College the following distinguished graduates of the College have been elected Honorary Fellows:—Lord Rayleigh, M.A., F.R.S., Professor of Experimental Physics; Mr. Henry Sidgwick, M.A., Prælector in Moral and Political Philosophy, the author of "The Method of Ethics"; Mr. Edward Herbert Bunbury, M.A., author of "A History of Ancient Geography," &c.; and Mr. William Henry Waddington, B.A., Member of the French Institute, late President of the Council, and Minister of Foreign Affairs in France.

The Adams Prize is to be given in 1883 for a general investigation of the action upon each other of two closed vortices in a perfect incompressible fluid. In particular it is suggested that the case of two linked vortices should be fully discussed, with the view of determining (1) whether any steady motion is possible, and (2) whether any motion can occur in which there are periodical changes in the forms and dimensions of the vortices. Each essay should be accompanied by a full and careful abstract pointing out the parts which the author considers to be new, and indicating the parts which are to be regarded as of more importance than the rest. The competition is open to all graduates of Cambridge; essays must be sent in on or before December 16, 1882. Essays must not be written in the candidate's own hand. The successful candidate will receive about 170*l*. He must print the essay at his own expense. The examiners are the Vice-Chancellor, and Messrs. A. Freeman, W. H. Besant, and E. J. Routh.

VICTORIA UNIVERSITY.—The following summary of draft regulations on degrees, examinations, and courses of study has been issued:—1. These regulations are, with the exception of certain general proposals with reference to University Matriculation, confined to the subjects of Degrees, Examinations, and Courses of Study in the Faculties of Arts and Science. 2. According to the proposals in the Report any certified student of a College incorporated in the University may matriculate at certain times in the year, the definition of College studentship being left to the College or Colleges, subject in each case to the approval of the University. No University examinations leading to a degree will be open to any persons who are not matriculated students. 3. According to the proposals in the Report there are to be two distinct Faculties of Arts and of Science. The degrees in these faculties are to be those of B.A. and M.A., B.Sc. and M.Sc., and a Doctorate common to the two Faculties and varying as a Doctorate of Literature, of Philosophy, and of Science. 4. In consonance with a main principle of the University Charter, the degrees of B.A. or of B.Sc. are to be conferred upon students who have passed certain prescribed University examinations, and who have attended certain prescribed University courses of study in a College of the University. 5. In the examinations for the degrees of B.A. and B.Sc., and in the privileges conferred by these degrees, a distinction is to be drawn between the Ordinary B.A. or B.Sc. degree, and the B.A. or B.Sc. degree with Honours. 6. The regular period of study required of candidates for the degrees of B.A. and B.Sc. is to be three years, of which two shall be after the date of their passing the Preliminary Examination (see § 7 of this summary); but students who have passed the Preliminary Examination (see § 7 of this summary) next in date after their matriculation, and have been placed in the first division of the list of successful candidates, shall be allowed to proceed to their degree in two years. 7. All candidates for the degrees of B.A. or B.Sc. are required to pass a general examination called the Preliminary Examination, and to present themselves for this examination not later than two years from the date of their matriculation. Regular first year courses of study are arranged as preparatory for this Examination, to be taken by all students except those who pass it immediately after matriculation (see § 6 above), or who go through the first year's course of one of the Honours Schools approved by the University. 8. The subjects of the Preliminary Examination are arranged in two groups (A and B), in one of which every candidate must pass. The essential difference between the two groups is that in A, Latin and Greek are compulsory, but that a choice is given between four subjects, including two modern languages and two elementary sciences; while in B a choice is given between the alternatives of two languages (ancient or modern) and one elementary science, or two sciences and one language (ancient or modern). In B the requirements in modern languages and mathematics are rather greater than in A. 9. The other examinations for the degrees of B.A. and B.Sc. will be open to such students only as have passed the Preliminary Examination, and as have attended the prescribed University courses of study in a College of the University. These further examinations will differ for students intending to present themselves for an Ordinary B.A. degree and for those desirous of a B.A. degree with Honours. 10. The degree of B.A. with Honours is to imply that a student has attended, during three years, prescribed courses of study (approved by the University) in a distinct branch of learning or science forming the subject of one of the Honours Schools of the Faculties of Arts and Science, and that he has passed a prescribed examination in such Honours School after attending its third year's course. The Honours Schools recommended in the Report for immediate establishment in the University are those of (1) Classics, (2) English, (3) History, (4) Philosophy, (5) Mathematics, (6) Engineering, (7) Chemistry, (8) Zoology, (9) Physiology, and (10) Geology, Mineralogy, and Palæontology. For all of these Honours Schools the Owens College is prepared to supply classes meeting the proposed requirements of the several Schools. 11. The Ordinary degree of B.A. or B.Sc. is to imply that a student has attended, during at least two years, prescribed courses of study (approved of by the University) forming a connected whole, and that he has passed an examination corresponding to the earlier year's course, to be called the Intermediate Examination, and an examination corresponding to the later year's course, to be called the Final Examination. 12. The courses of study, and the corresponding examinations, prescribed for the Ordinary degrees of B.A. and B.Sc., and open to the choice of candidates who have passed either group of the Preliminary Examination, vary according to the predominance in each course (with its examinations) of one branch of learning or science. This predominance is not however such as to warrant the maintenance of the designations given (for convenience' sake) in the Draft Regulations of "mainly Classical, Historical, English, Philosophical, Mathematical, Engineering, Experimental Science, and Biological." Candidates for an Ordinary B.A. or B.Sc. degree may choose any of these groups, but must go through the whole two years' course, and pass both the examinations of the group chosen. The examinations and classes however largely coincide in particular portions of the several groups. 13. With a view to encourage more advanced study in special branches of learning or science in students whose bent has been determined, or whose capabilities have been developed, at a later stage of their University career, students who have passed the Final Examination for an Ordinary B.A. or B.Sc. degree, are to be allowed to present themselves for examination for a B.A. or B.Sc. degree with Honours, after attending the third, or second and third, year's Honours Course, only in one of the Honours Schools. 14. The degree of Master of Arts or of Science is to be conferred upon Bachelors of Arts of three years' standing, after not less than six years from the date of their matriculation. B.A.s who have graduated with Honours are not to be required to pass any further examination for the M.A. degree; those who have taken the Ordinary B.A. or B.Sc. degree are to be required to pass an examination in some portion of one of the Honours Schools Examinations. 15. The Doctor's degree in the Faculties of Arts or Science is to be conferred upon M.A.s or M.Sc.s who have furnished evidence of special research or learning, to be supplemented when desirable by an examination test.

SCIENTIFIC SERIALS

Bulletin de l'Académie Impériale des Sciences de St. Pétersbourg, t. xxvii., No. 1, February, 1881.—On the results of experiments on the resistance of the air and their application to the solution of problems of firing, by M. SOCIETIES AND ACADEMIES

London

Royal Society, March 31.—On the coefficients of expansion of the iodide of lead, and of an alloy of iodide of lead with iodide of silver, by G. F. Rodwell, Science Master in Marlborough College.

The iodide of lead was examined by the special means described by the author in former communications to the Society, and was found to possess three coefficients of expansion. Between 0° and 205° C. the coefficient of cubical expansion for 1° C. is ·00007614, increasing to ·00008307 between 205° and 253° C.

Between 253° and 265° C. the mass expanded very rapidly, with a coefficient nearly eight times greater than the preceding, viz. ·0006378. After the subsidence of this rapid expansion the coefficient became ·000180. The volumes of the iodide between 0° and the fusing point (383° C.) are given, and are shown in a curve-table.

Iodide of lead was fused with iodide of silver in such proportions as to form an alloy containing one molecule of each constituent, viz. PbI_2, AgI. This contains 66·20 per cent. of iodide of lead, and 33·80 per cent. of iodide of silver. The melting-point of the alloy was found to be 350° C., the specific gravity 5·912. On heating it was found to expand under a very low coefficient between 0° and 118° C.; then it neither expanded nor contracted while heated through 6° C.; at 124° C. it commenced to contract, and underwent between 124° and 139° C. as much contraction as iodide of silver itself; again it was stationary for 5° C., and at 144° C. it began to expand again, with a much higher coefficient than it possessed between 0° and 118° C.

The following are some noticeable points about the alloy:—

1. It possesses similar densities at three different temperatures.

2. Although it contains only 33·8 per cent. of iodide of silver it contracts as much during heating as the iodide of silver itself.

3. While the iodide of silver commences to contract at 142° C., and terminates at 145°·5 C., the alloy commences to contract 18° C. lower, and terminates its contraction 6°·5 C. lower.

4. The harsh sounds emitted during the cooling of the alloy, and the tremors simultaneously propagated through its mass, prove that violent molecular agitation is taking place while the iodide of silver is passing from the amorphous plastic condition, into the brittle crystalline condition within the mass of, or surrounded by the molecules of, the iodide of lead.

5. The fusing-point of the alloy is 33° lower than that of the iodide of lead, which constitutes two-thirds of its weight, and 177° lower than that of the iodide of silver, which constitutes one-third of its weight.

6. And if this is due to the fact that similar particles of matter attract each other more powerfully than dissimilar, and hence that when the particles of two bodies are mutually diffused the attraction becomes less than that of the molecules of either one of them singly, and the molecular motion is hence more easily assimilated, the same cause may explain the commencement of the phase of contraction on heating the alloy at a temperature 18° C. lower than that of the iodide of silver to which it owes this property.

7. If we compare one of the chlorobromiodides of silver, before described by the author (*Proc.* Roy. Soc., vol. xxv. p. 295) with the lead-silver iodide alloy, some curious anomalies present themselves. The alloy, AgI, AgBr, AgCl (lately also discovered as a mineral), contains 41·484 per cent. of iodide of silver, and 58·516 per cent. of the chloride and bromide of silver (which from an expansion point of view may be regarded as the same substance, because their co-efficients are practically the same). But although the mean coefficients of expansion of the chloride and bromide scarcely exceed those of the iodide of lead, and although the chlorobromiodide contains 8 per cent. more iodide of silver than the lead-silver iodide alloy, the amount of *contraction* by heat of the latter is more than twenty times greater than that of the former, although we must believe this effect to be solely due in each case to the presence of the iodide of silver.

Mathematical Society, April 14.—S. Roberts, F.R.S., president, in the chair.—The chairman briefly, but feelingly, alluded to the loss the Society had sustained by the recent death of Mr. T. Cotterill, M.A., formerly Fellow of St. John's College, Cambridge, who was for many years a member of the Council, and had always taken a warm interest in the Society.

—The following communications were made:—On the geodesic curvature of a curve on a surface, Prof. Cayley, F.R.S.—On operative symbols in the differential calculus, Prof. Crofton, F.R.S.—Note on the resolution in factors of numbers differing but slightly from π, Mr. J. W. L. Glaisher, F.R.S.—On the nature of the quadric represented by the general equation of the second degree in tetrahedral co-ordinates, and on the five focal quadrics of a cyclide, Mr. H. Hart, M.A.—The discrimination of the maximum or minimum path of a ray of light reflected at a given curve, Mr. H. M. Taylor, M.A.—On certain tetrahedra specially related to four spheres meeting in a point, and historical note on Dr. Graves's theorem on confocal conics, the President.

Physical Society, April 9.—Prof. W. G. Adams in the chair.—Prof. Helmholtz was elected an honorary member of the Society, and Dr. James Moser an ordinary member.—Dr. J. H. Gladstone read a note on thermal electrolysis, by himself and Mr. Alfred Tribe. The authors found that when sheet-silver was plunged into fused silver chloride or iodide of silver crystals of silver formed on the sheet. When copper was immersed in fused cuprous chloride copper crystals deposited on it, and when zinc was placed in melted zinc chloride or iron in melted ferrous chloride, these two metals crystallised on the plates. They found this to be due not to a difference in the physical condition of the rolled metals, but to the unequal heating of the different parts of the immersed metals. By the contact theory of voltaism there will be a difference of potential between the metal and the liquid chloride in contact with it, and this difference of potential will vary with temperature. Since all parts of the immersed metal cannot be supposed at the same temperature always, there is the possibility of a current being set up and consequent electrolysis of the salt. This view was corroborated by heating the metal unequally, when a crop of crystals appeared in the cooler part of the liquid. Again, two silver rods connected together were plunged, the one in a hotter, the other in a cooler part of fused silver chloride, and at the end of fifteen minutes the latter was studded with crystals of silver, whilst the former was clean. A galvanometer showed a stronger current between the rods, the greater the difference of temperature between the parts of the fluid in which they were placed, and transposing the rods reversed this current. These experiments bear on the nature of voltaic action, and form a lecture-illustration of the conversion of heat into electricity and chemical force. Mr. W. H. Walenn stated that he had found when zinc is immersed in an electro-brassing solution, crystals of brass (*i.e.*, zinc and copper) were deposited on it.—Capt. Abney exhibited a number of photographic negatives taken by himself and Col. Festing, by radiation through thin sheets of ebonite. The light from the positive pole of an electric lamp was sent through a thin sheet of ebonite $\frac{1}{32}$ inch thick, and photographs taken showed the radiation to have a low wave-length, from 8000 to 14,000. The carbon points of the lamp could be photographed through the sheet, and Col. Festing observed the sun's disk through it. The ebonite showed a grained structure, and different samples of ebonite gave different results, but all gave some result in course of time at least; old ebonite, like that used in some of Mr. Preece's experiments, scattering the light more than new ebonite.—Dr. Moser exhibited the passage of the rays through the ebonite to the audience by means of a galvanometer. Prof. Guthrie observed that Capt. Abney had proved that light as well as heat traversed the ebonite, and Dr. Coffin stated that the composition of ebonite apparently the same might vary considerably, and hence its radiant transparency might vary too.—Prof. Helmholtz addressed the meeting on the localisation of objects by the eyes. We estimate distance with one eye by the outlines of the more distant objects being covered by the nearer ones where they meet, and by the shadows thrown by the anterior objects. These conditions are very rarely overpowered by others, as, for instance, binocular vision. This is shown by Dove's pseudoscope and the fact that closing or blinding one eye makes little difference to the power of judging distance, especially when not very close to the eye. The relative shifting of objects, as the eye is moved from side to side, or to and fro, or up and down, which may be called the parallax of motion of the head, is also a strong factor in estimating distance. The author had concluded from a study of the stereoscope that the perception of the absolute convergence of our eyes is very indistinct, and that only differences of convergence related to apparently near or distant objects produce the stereoscopic effect. Recent observations of his show that the incongruity between the degree of convergence and the parallax of motion is perceived with great accuracy. Dr. Stone remarked that a person suddenly blinded in one eye acquires a new judgment of distance by moving the head (a habit seen in nocturnal birds), and in taking certain French stereoscopic pictures the camera is shifted to another point, so that the combined images produce an impression of smallness in the object. These facts corroborated Prof. Helmholtz's view; and Mr. Lewis Wright pointed out that santonin, which changes the sense of colour, also appears to change the sense of distance, perhaps by relaxing the muscular sense.

Geological Society, April 6.—J. W. Hulke, F.R.S., vice-president, in the chair.—Edward F. Boyd, Lieut. Herbert de Haga Haig, R.E.; J. C. Margetson, Edward David Price, and James Tonge were elected Fellows of the Society.—The following communications were read:—The microscopic characters of the vitreous rocks of Montana, U.S., by F. Rutley, F.G.S., with an appendix by James Eccles, F.G.S.—On the microscopic structure of devitrified rocks from Beddgelert, Snowdon, and Skomer Island, by F. Rutley, F.G.S.—The date of the last change of level in Lancashire, by T. Mellard Reade, C.E., F.G.S. The author described some observations made by him at Blundellsands, on the coast of Lancashire, near Liverpool, according to which, judging from the position of high-water mark, the land had gained considerably upon the sea between 1866 and 1874. The author adduced evidence in support of his view, and concluded that if the last change of level in South-West Lancashire was a downward one it could not have taken place within 2500 years.

Institution of Civil Engineers, April 5.—Mr. Brunlees, F.R.S E., vice-president, in the chair.—The paper read was on the actual lateral pressure of earthwork, by Mr. B. Baker, M. Inst. C.E.

EDINBURGH

Royal Society, April 4.—Prof. Balfour in the chair.—Prof. Tait communicated the results of his experiments on the pressure errors of the *Challenger* thermometers, the correction for which, as originally furnished to the expedition, was 0°·5 F. per mile of depth. The mode of experimenting was to subject the thermometers to considerable pressure in a hydraulic press, which was essentially a strong steel cylinder that was warranted to stand a pressure of 25 tons weight on the square inch. It was supported in an upright position upon a strong tripod stand. Water was filled in from above; and into the upper end of the cylinder there was lowered a tight-fitting plug which was fixed in position by a transverse steel bolt. The lower end of the cylinder was connected through a narrow copper tube to a hydraulic pump, which, by pumping in water to the cylinder, raised the pressure to the required amount. At three tons pressure an average effect of 1°·5 F. was produced upon the inclosed thermometers. Before drawing any conclusions as to the correction to be applied in deep-sea sounding, it was necessary to consider how far this effect could be explained as resulting from the peculiar conditions under which the experiments were made. From the known compressibility of glass it was calculated that the volume of the bore of a thermometer tube, closed at both ends, would be diminished by only one-thousandth part for an increase of pressure of one ton weight on the square inch; and from a direct experiment made with a metre-long tube this was proved to represent very approximately the real effect. Hence it was quite out of the question that this could have any appreciable effect on such comparatively short thermometers as those of the *Challenger*, which were besides subject to much graver errors, such as those arising from the shifting of the indices during the ascent from the depths, or even from the effect of parallax when taking the reading. The direct action of pressure may then be disregarded, and the effect produced upon the thermometers in the compression apparatus must be due to secondary effects of pressure, such as evolution of heat. The various sources of heat were four: 1. Heating of the water by compression. This depends greatly on the original temperature of the water, being *nil* at the point of maximum density (40° F.), and larger for higher temperatures. One-fourth of the total effect is due to this. 2. Heating of the water due to pumping in through the narrow tube. This accounts for three-twentieths of the effect. 3. Heating of the vulcanite frame by compression. This explains another fifth. 4. Heating due to the effect upon the protecting bulb. This probably explains the remaining two-fifths of the effect. In this last case however there is not only compression, but distortion; and of the thermal effects of such a strain no one yet knows anything. These four sources of error cannot be supposed to exist under the conditions in which deep-sea temperatures are taken; and the only other possible source, that namely due to the direct effect of pressure, gives rise to an error which requires a correction of only 0°·04 F. per mile of depth. In the course of the description of experiments Prof. Tait had occasion to describe the various kinds of pressure-gauges which he had found it necessary to devise, the ordinary forms of gauge being altogether useless for scientific work.—Mr. W. W. J. Nicol read a paper on the action of heat on thioformanilide, being an account of experiments he had made in Prof. Hoffman's laboratory at Berlin during the preceding winter.—Mr. Patrick Geddes read the second instalment of his scheme for the classification of statistics. In it he discussed the arrangement of statistics relating directly to the organisms of the society. Three great parallel classes, A, B, C, were formed: A being concerned with the *source* of the organisms forming a community as arising from survival, immigration, and birth; C with the *loss*, from emigration and death; while B contained the biological and social characteristics of the individuals forming a community at any given instant of time. Classes A and B formed the one side and C the other side of the social balance sheet. In treating of occupations the same three classes appeared again: A dealing with operations on matter and energy, B with services rendered to society (including education, government, &c.), and C forming the class of the essentially unproductive, *e.g.* the unemployed, the disabled, the destructive, &c. The question of partition, both mediate and ultimate, amongst the organisms of matter and energy fell next for discussion; and this led on to the final classification of uses made after partition, in all of which it was shown that the classification fitted naturally into the three original classes, A, B, and C, indicated above. In a future paper Mr. Geddes hoped to demonstrate the *practical* value of his system.

VIENNA

Imperial Academy of Sciences, April 7.—L. Fitzinger in the chair.—The following papers were read:—Dr. G. Becka, on the orbit of the "Ino" planet (No. 173).—Dr. E. Ludwig, on a new method for the quantitative determination of uric acid.—Dr. D. Dubller, on the influence of continual use of carbonate of soda on the composition of the blood.—Dr. James Moser, electrostatic investigations especially into the ramification of induction on the differential inductometer and electrophorus.—Dr. Moritz Holl, on the blood-vessels of the placenta of man.—L. Haitinger, on nitro-olefines.

Imperial Institute of Geology, March 15.—E. Kittl, on a recent find of Listriodon (found at Nussdorf, near Vienna, in 1879).—Dr. E. Mojsisowics, on the cephalopod-fauna of the Triassic formations at Mora d'Ebro, in Spain.—K. M. Paul, on the occurrence of ozokerite and petroleum at Boryslaw (Gallicia).

April 5.—E. Kittl, on Bohemian spas.—Baron H. Fullon, observations on crystallisation.—Dr. V. Hilber, on the terminal stratifications of gypsum in Eastern Gallicia.

PARIS

Academy of Sciences, April 11.—M. Wurtz in the chair.—The following papers were read:—On peroxide of ethyl, by M. Berthelot. This may be prepared by sending through anhydrous ether, for several hours, a slow current of quite dry and strongly ozonised oxygen. The formation of oxygenated water by action of ozone on ether is not immediate, but by destruction of a first compound, viz. peroxide of ethyl. This substance is a sesquioxide $C_8H_{10}O_6$.—On the Eulerian integral of the second species, by M. Gyldén.—Researches on the liquefaction of gaseous mixtures, by MM. Cailletet and Hautefeuille. Operating with a gas easily liquefiable and a so-called permanent gas, in capillary tubes, total liquefaction (yielding a homogeneous liquid) is obtained by first compressing the mixture at a temperature so high that the strongest pressures prove powerless to abolish the gaseous state, then lowering the temperature regularly, so that all points of the tube pass at the same time through the temperature at which is produced a change of state. The authors thus obtained condensed carbonic acid, holding a large proportion of oxygen, hydrogen, or nitrogen, these latter substances concurring to form the liquid, though the temperature was too high for them to exist separately in that state. The results of experiment with cyanogen and carbonic acid are analysed. The assimilation (generally very imperfect) of solution of a gas to its liquefaction probably here applies. The mixture retains its characters at temperatures considerably above that corresponding to the critical point of its less easily liquefied element.—On the lines of iron in the sun, by Mr. N. Lockyer. He shows reason for believing that iron does not exist in the heart of the sun, but only its constituents, and these exist at different levels in the sun's atmosphere and produce more complex forms by condensation.—On pucerons attacked by a champignon, by MM. Cornu and Brongniart. The insect belongs to the cycle of development of *Tetraneura rubra*, which produces the red galls of elm. The fungus is a *Pleospora*; it attacks the dead puceron. It is probably incapable of affecting much the multiplication of phylloxera.—On the integration of linear equations by means of Abelian functions, by M. Poincaré.—On formulæ of representation of functions, by M. du Bois-Reymond.—Study of the vapour of bisulphydrate of ammonia, by M. Isambert. The substance is less volatile in presence of its elements than *in vacuo*, or in an inert gas such as hydrogen.—On chlorides, bromides, and iodides of sulphur, by M. Ogier. A thermo-chemical study.—On the development of *Tricuspidaria nodulosa* or *Triænophorus nodulosus* of Rudolph, and on its cysticercus, by M. Megnin. The perches of the Seine are greatly affected by this parasite at present.—Studies on some points of the anatomy of *Sternaspis scutata*, by M. Rietsch.—On the different species of bears whose remains are buried in the cavern of Lherm (Ariège), by M. Filhol. Remains of an enormous *Ursus arctos* (apparently) have been found among about 100 bones of *Ursus spelæus*. M. Filhol doubts the descent of the former bear from the latter. He supposes that *Ursus arctos*, appearing in distant regions (perhaps North America), gradually advanced and was substituted in our countries for *Ursus spelæus*. Bone fragments of a new type of bear have been found in this cave. The author names it *Ursus Gaudryi*. The fossil femur of an enormous lion has also been found.—Production of a hydrated silicate of baryta in crystals, by M. Le Chatelier. This appears on the inner surface of vessels of baryta water left standing uncleaned a long time.—On the production of a crystalline phosphide of iron and of anorthite felspar in the fires of the Commentry coal-pits, by M. Mallard.—On the swelling of the Seine during the winter of 1881, by M. Lemoine. The Seine at Paris has been pretty high from the middle of January to the middle of March. Usually (as M. Belgrand has shown) the maximum of flood at Paris is due to the waters of small torrential rivers mostly in the upper part of the valley and issuing from impermeable strata. But last winter, it is chiefly the rivers nearest Paris, those of Brie, that, by their quite unusual swelling, have brought on the maximum (which has therefore come with great rapidity). The subsoil of La Brie is like a sponge, and when it is gorged with water the least rain causes important floods.

SCIENTIFIC WORTHIES

XVII.—Robert Wilhelm Bunsen

THE value of a life devoted to original scientific work is measured by the new paths and new fields which such work opens out. In this respect the labours of Robert Wilhelm Bunsen stand second to those of no chemist of his time. Outwardly the existence of such a man, attached, as Bunsen has been from the first, exclusively to his science, seems to glide silently on without causes for excitement or stirring incident. His inward life however is on the contrary full of interests and of incidents of even a striking and exciting kind. The discovery of a fact which overthrows or remodels our ideas on a whole branch of science; the experimental proof of a general law hitherto unrecognised; the employment of a new and happy combination of known facts to effect an invention of general applicability and utility; these are the peaceful victories of the man of science which may well be thought to outweigh the high-sounding achievements of the more public professions.

Prof. Bunsen is eminently a soldier of science, his devotion to his flag has been unwavering and life-long, and his whole existence has been a noble struggle for the mastery of nature's secrets. Born on March 31, 1811, at Göttingen, where his father was Professor of Theology, Bunsen graduated in that ancient University before he had passed through his teens, and published an inaugural dissertation, "Enumeratio ac descriptio hygrometorum." Soon afterwards, at the age of twenty-two, he became a privat-docent at the university of his native town, thus entering the career of a teacher, which he has consistently followed with conspicuous success for close on half a century. In 1836 Bunsen became Professor of Chemistry at the Polytechnic School in Cassel; in 1838 he was appointed to the Chair of Chemistry in the University of Marburg, where he remained for thirteen years; afterwards he was for a short time at Breslau, whence he removed to Heidelberg, of which renowned University he has been one of the chief ornaments and attractions for the last thirty years.

Bunsen's first scientific investigation was one which attracted general attention, and the results of which are of permanent importance. In conjunction with Berthold, a colleague at Göttingen, he showed that moist freshly precipitated ferric hydroxide acts as a certain antidote in cases of poisoning by arsenic, provided that it is exhibited in sufficient quantity and early enough in the history of the case. The explanation of this action is the formation of an insoluble ferrous arsenite; 100 parts of the dry hydroxide carry down from five to six parts of arsenic. So well known and valued is this antidote in Germany, that it is kept by apothecaries ready for use.

In 1835 Bunsen described some singular compounds which the double cyanides form with ammonia. He contradicted the general statement that ammonium ferrocyanide is formed by boiling prussian blue with ammonia; but showed that it is formed by digesting lead ferrocyanide with ammonium carbonate. He also measured the angles of crystals of many of the double cyanides.

In 1837 he struck the first note of one of his most important and fruitful investigations in a memoir on the existence of arsenic as a constituent of organic bodies. In the year 1760 the French chemist Cadet had observed that a mixture of acetate of potash and white arsenic yields, when heated, a heavy brownish-red liquid, which has a frightful smell and fumes strongly in the air, and this liquid was termed Cadet's fuming arsenical liquid. Little more than the fact of its existence was ascertained concerning this body until Bunsen undertook its examination, and in a series of memoirs which have now become classical, and which extended over many years, placed its composition in a true light, thus giving to the world the first member of the now well-known family of the organo-metallic bodies.

Bunsen showed that Cadet's liquid, as well as its numerous derivatives, contains a radical having the formula C_4H_6As, and that this substance in its chemical relations exhibited striking analogies with a metal, being indeed, as he terms it, "a true organic metal." He succeeded in isolating this body, and this discovery formed not only the starting-point for the preparation of hundreds of other similar bodies, but also contributed largely to the development of one of the most important of our chemical theories, that of compound radicals. This body, like most of its compounds, possesses a most offensive odour, so much so that the air of a room containing a trace of the vapour is rendered absolutely unbearable. Hence to this substance Bunsen gave the name of Cacodyl (κακώδης, a bad smell). Not only however are these compounds unpleasant, but they are highly poisonous, very volatile, dangerously explosive, and spontaneously inflammable. It is difficult enough nowadays for a chemist to work with such substances armed as he is with a knowledge of the danger which he has to encounter, as also with improved appliances of every kind to assist him in overcoming his difficulties. But Bunsen forty years ago was a traveller in an unknown and treacherous land, without sign-posts to guide him, or more assistance on his journey than was furnished by his own scientific acumen and his unfaltering determination. Nor did he escape scot-free from such a labour, for in analysing the cyanide of cacodyl the combustion tube exploded, Bunsen lost the sight of an eye, and for weeks lay between life and death owing to the combined effects of the explosion and the poisonous nature of the vapour. "This substance," he writes, "is extraordinarily poisonous, and for this reason its preparation and purification can only be carried on in the open air; indeed, under these circumstances it is necessary for the operator to breathe through a long open tube so as to ensure the inspiration of air free from impregnation with any trace of the vapour of this very volatile compound. If only a few grains of this substance be allowed to evaporate in a room at the ordinary temperature, the effect upon any one inspiring the air is that of sudden giddiness and insensibility, amounting to complete unconsciousness."

Taking a totally different direction, Bunsen's next important investigations were concerned with the examination of the chemical changes which occur in the blast-furnace. In 1838 he proved, by accurate analyses of the gases escaping, "that at least 42 per cent. of the heat evolved from the fuel employed is lost, and that in view of the ease with which such combustible gases can be collected and led off to a distance for subsequent use, a new and important source of economy in the iron manufacture is rendered possible." This research is however not only noteworthy as pointing the way to a method of economical working without which probably but few iron-masters at the present day could exist, but also as being the first experiment in which an accurate method of gas-analysis was employed. This important branch of analytical chemistry has been created and brought to its present wonderful degree of precision solely by the head and hands of the Heidelberg experimental philosopher. Simplicity and accuracy constitute the rare merits of Bunsen's system of gaseous analysis. To have gone completely through his course of gas analytical manipulations from the sealing-in of the platinum wires in the eudiometer to the absorption- and explosion-analyses of the Heidelberg coal-gas, under the eye and with the guilding help of the hand of the master, is in itself an experimental education of no mean order. But it is only on reference to his "Gasometric Methods" that we learn the general adaptability of this marvellously accurate system to all those numerous problems in which the analysis of a mixture of gases is required.

Next in order (1841) comes the invention of the Bunsen battery, an invention which has proved of the greatest practical value to mankind, inasmuch as this form of battery is now very largely used all over the world, not only as a scientific instrument, but also for ordinary telegraphic purposes. The chief point in this invention consists in the employment of carbon as the negative pole in place of copper or platinum. In his first communication on this subject, Bunsen accurately measures the absolute intensity of the current from his zinc-carbon battery, and compares it with that of a Grove (zinc-platinum) battery, invented a short time before by Sir William Grove.

Bunsen's next great achievement consists in the investigation from both the chemical and the physical point of view of the volcanic phenomena of Iceland. The several memoirs on this subject are the result of a visit to Iceland in 1847. They consist, in the first place, of a careful and extended series of analyses giving the average composition of the volcanic rocks of different ages occurring in the island, upon which he founded a most important and very general theory of volcanic action, a theory which he has since proved is applicable to the formation of other volcanic rocks of widely different origin, both as regards time and locality. This theory consists, to begin with, in a proof that all the Islandic rocks, of whatever age, may be considered as mixtures in varying proportions of two normal silicates, the trachytic and pyroxenic. In the first of these (an acid silicate) the relation of the oxygen of the acid to that of the bases is as 3 : 0·596, whilst in the latter (a basic silicate) the relation is as 3 : 1·998. This result, accompanied by an experimental proof that the melting-point of different bodies is differently raised under increase of pressure, led Bunsen to assume that a crystallisation of these two normal silicates occurs in the earth's interior, and that all the eruptive rocks which reach the surface consist either of one or other of these or of mixtures of the same. In the next place they contain a full and successful research on the so-called pseudo-volcanic phenomena of Iceland, in which he investigates the formation of zeolites and other crystalline minerals by the joint action of heat, acid gases, and moisture on the volcanic rocks. He also examines the composition of the fumerolle gases as well as those issuing from the crater of Hecla, and explains the nature of the changes effected by these gases on the surrounding rocks. Lastly, he investigates the far-famed Great Geyser, and places the cause of the periodic eruption of boiling water on its true physical basis. His accurate observations on the spot, first as to the construction of the geyser-tube, then as to its mode of formation, and finally, his thermometric measurements of the temperature of the water-column taken a few moments before the eruption and at different depths, disposed once for all of what may be called the old tea-kettle theory, and showed indisputably that in no part of the tube did the water reach the temperature of ebullition under the pressure of the superincumbent column, whilst the column is quiescent, but that when the geyser column is elevated by the rush of steam from the volcanic vents at the bottom, the boiling-point of the water at each point of the column thus raised is reached, and "the whole mass from the middle downward suddenly bursts into ebullition, the water above mixed with steam-clouds is projected into the atmosphere, and we have the Geyser eruption in all its grandeur. By its contact with the air the water is cooled, falls back into the basin, partially refills the tube in which it gradually rises, and finally fills the basin as before. Detonations are heard at intervals, and risings of the water in the basin. These are so many futile attempts at an eruption, for not until the water in the tube comes sufficiently near its boiling-point to make the lifting of the column effective can we have a true eruption" (Tyndall).

To do justice to all the contributions with which Bunsen has enriched our science would fill several numbers of NATURE, and to many of them the writer must content himself with a mere cursory reference. One of his favourite and fruitful themes was the preparation by electrolysis of the rarer or more difficultly procurable metals. This is one of the purposes for which he employed his battery. Metallic magnesium was one of the first of his preparations of this kind, and in the description of this preparation his fertility of resource is clearly seen. Metallic magnesium in the molten state is specifically lighter than the fused mixture of salts from which it is obtained. Hence as soon as a globule of the metal is formed, it rises to the surface, and there takes fire and burns. To obviate this difficulty the carbon pole on which the metal was formed was serrated, and the metal on rising was caught, below the surface of the fused salt, in one of a series of small pockets, and thus prevented from burning.

Then followed the reduction of chromium, aluminium, and, in conjunction with the late Dr. Matthiessen, that of the alkaline-earth metals, and more recently with Hillebrand and Norton, of the metals of the cerium group. These electrolytic researches are marked with the thoroughness and completeness which is characteristic of all Bunsen's work. He seeks for the explanation of the fact that hitherto the reduction of these metals by the electric current had proved a failure, and he finds it in what he terms the density of the current, *i.e.* the electromotive force divided by the area of the pole, the power of the current to overcome chemical affinity increasing with its density. Thus if a constant current be led through an aqueous solution of chromic chloride, the result as to whether hydrogen is evolved, and oxide of chromium, or whether metallic chromium is deposited, depends upon the area of the pole through which the current passes into the liquid.

Nor were these experiments made merely for the purpose of preparing the metals in question. Thus the metallic magnesium was pressed into wire and used in one of the series of photo-chemical researches, to which reference will hereafter be made, for the purpose of drawing an interesting conclusion respecting its light-giving power on combustion, and comparing this with the visual and chemical brightness of the sun, a comparison which led to the commercial manufacture of this metal by the Magnesium Metal Company, and to the wide distribution and general use of this metal as an illuminating agent of great brilliancy. Thus again the electrolytic preparation in the Heidelberg laboratory of coherent masses of cerium, lanthanum, and didymium, had the further object of the determination of the specific heat of these metals by help of the now well-known method with Bunsen's ice-calorimeter, by means of which determination the true atomic weights of these metals and the proper formulæ of their oxides and compounds have been definitely ascertained.

The Bunsen battery has however not only been of service in inorganic chemistry, but has thrown clear light upon the constitution of organic bodies. The classical researches of Kolbe on the electrolysis of acetic acid and the other fatty acids were carried out in the Marburg laboratory, and owe their inspiration to Bunsen. The subsequent equally important labours of Kolbe and Frankland, and those of the latter chemist alone, on the isolation of the organic radicals, have a like origin.

Amongst the numerous physico-chemical investigations which Bunsen has carried out, none perhaps show more clearly the fertility of his experimental ability than the one in which he describes the ice calorimeter, and another devoted to an explanation of a new method of determining vapour densities. Translations of these memoirs are found in the *Philosophical Magazine* for 1867 and 1871, and may be taken as typical of his calorimetric researches.

Another group of researches is formed by those which are closely related to his gasometric methods. One of the most interesting and important of these refers to the law of absorption of gases in water. This subject was first examined by Dalton and Henry at the beginning of the century, and the well-known law which gases follow in absorption is known by the names of these two Manchester philosophers. But although generally admitted, its limits of error had not been ascertained, and the crude experimental methods of the year 1803 required to be replaced by the refined ones of the latter half of the century. These researches, carried on by Bunsen and by several of his pupils, proved that Henry's law of direct—as well as that of Dalton of partial—pressures is exactly true within certain limits; but ceases to be so beyond a given increase of pressure, whilst some gases which obey the law at one temperature do not do so at others, and some again whilst obeying it in the pure state, do not do so when mixed with other gases.

The mere mention of his other researches in the wide field of gaseous chemistry is sufficient to indicate his devotion to this branch of experimental inquiry. We find experiments on laws of gaseous diffusion, on applications of gaseous diffusion in gasometric analysis, on the phenomena of the combustion of gases, on the temperature of ignition of gases, and all these, be it remembered, involving exact measurement, and in many cases elaborate calculations.

Brief reference must next be made to a series of investigations in a totally different direction, viz. on the measurement of the chemical action of light, with the carrying out of which the writer of this article had the great good fortune and pleasure to be connected, and in which he had full opportunity of admiring Bunsen's untiring energy and wonderful manipulative power. In all the difficulties and perplexities by which the experimental investigation of such a subject is beset, the writer never knew Bunsen discouraged or at a loss for an expedient by which an obstacle could be overcome. Cheerful and self-reliant under the most depressing circumstances, he never gave up hope, and thus it was that these somewhat intricate and difficult investigations were brought to a successful close.

Again, in the department of Analytical Chemistry how numerous and valuable have been his contributions! There is scarcely one important problem in this subject which has not benefited from his extensive experience and keen insight. Bunsen's methods of silicate analysis, of mineral water analysis, and a dozen of other complicated laboratory processes, are simply perfect. Then his original method for the estimation of nitrogen in organic bodies will always be remembered as one of the most accurate of its kind when employed by an experimentalist as expert as Bunsen himself, but as most difficult and even dangerous in less able hands. Again, all chemists use and appreciate the much simpler methods for the estimation of nitrogen and sulphur admirably worked out by his pupils—Maxwell Simpson and Russell.

We all employ his beautiful general method of volumetric analysis, but chemists do not always remember that in this research Bunsen first determined the exact percentage composition of the higher oxide of cerium, a determination of the greatest scientific importance as regards the chemistry of the metals of the rare earths. Moreover they may be apt to forget that Bunsen was the first to introduce a general method of the separation of these rare earths, by which he for the first time prepared pure yttria and erbia, and by which subsequently, in the hands of other chemists, many new metals have been discovered. His well-known method of flame-reactions is a standard example worked out by every student. Again, modern chemists can now scarcely carry on the simplest experiment without using the "Bunsen gas-lamp," a burner which is also now employed in every household, and in many manufactories, and has become so necessary that it is difficult to conceive how we worked before its invention. To him we are also indebted for the apparatus for accelerating filtration, the "Bunsen-pump," together with all its appliances, now employed in every laboratory.

Of all the contributions to the advancement of our science, that by which the name of Bunsen has, however, become best known, and by virtue of which future generations will place him on the highest pinnacle of experimental fame, is the foundation, with his no less celebrated colleague Kirchhoff, of the science of Spectrum Analysis, and the discovery by its means of the two new alkali metals, cæsium and rubidium. It is true, of course, that many facts were ascertained and many observations made relating to the power possessed by matter in the state of incandescent gas emitting rays of a peculiar and characteristic kind. Few great discoveries are made at one step. But the glory of having established a new branch of science, of having placed "Analysis by Spectrum Observations" on a sound and firm experimental basis, belongs to the Heidelberg philosophers, and to them alone.

The history of the establishment of spectrum analysis, as that of its enormous recent developments, is too well known to the readers of NATURE to require repetition. All that is necessary here is to recall the masterly way in which Bunsen worked out the properties and showed the relationships of the new metals and their compounds. He first saw the cæsium lines in a few milligrams of the alkaline residue obtained in an analysis of the Dürkheim mineral waters, and the discovery of a second new metal (rubidium) soon followed that of the first. So certain was he of the truth of his spectroscopic test that he at once set to work to evaporate forty tons (44,000 kilos) of the water, and with 16·5 grammes of the mixed chlorides of the two new metals which he thus obtained, he separated the one metal from the other (no easy task) and worked out completely their chemical relationship and analogies, so much so that the labours of subsequent experimenters have done little more than confirm and extend his observations; such a result is truly a marvel of manipulative skill!

Another less widely known, but no less interesting and important research, is that on the spark-spectra of the metals contained in cerite and other rare minerals. In this he shows his power both as physicist and chemist. He first describes a new chromic-acid battery suited to the performance of the special experiments which he afterwards details. He determines with great care all the physical constants of this battery, and then proceeds to investigate the spectra of the earths which give no colour to the non-luminous flame. The spark-spectra of these earths he carefully maps, so completely, indeed, that the separation and identification of these metals now for the first time became possible.

The many hundreds of pupils who during the last half-century have been benefited by personal contact with Bunsen will all agree that as a teacher he is without an equal. Those who enjoy his private friendship regard him with still warmer feelings of affectionate reverence. All feel that to have known Bunsen is to have known one of the truest and noblest-hearted of men.

H. E. ROSCOE

JAPAN

Japan, nach Reisen und Studien in Auftrage der K. Preuss. Regierung dargestellt. Von J. J. Rein, Professor der Geographie in Marburg. Erster Band. Natur und Volk des Mikadoreiches. (Leipzig: Engelmann, 1881.)

Notes and Sketches from the Wild Coasts of Nipon. By Capt. H. C. St. John, R.N. (Edinburgh: Douglas, 1880.)

THE present year has already brought two new contributions to the rapidly increasing stock of Japanese literature in "Japan, nach Reisen und Studien," by Prof. Rein of Marburg, and "The Wild Coasts of Nipon," by Capt. St. John. The two works thus thrown into association by subject and time of publication have however nothing else in common.

Had Capt. St. John's book been written a few generations ago, or had it related to a country previously unexplored, it would have possessed a greater claim upon popular interest; but Japan has in late years been so far the object of careful study by residents, and of descriptions by tourists, that the *raison d'être* of "The Wild Coasts of Nipon" is not easy to perceive.

In the preface the reader is assured that everything stated in the text, with a few exceptions, came under the observation of the author, and there is no doubt that he has scrupulously confined himself to his own personal experience, without seeking to correct or augment it by reference to other sources. The advantage of such a limitation of matter must however depend altogether upon the extent of the experience and the special qualifications of the observer, and we are of opinion that had the author taken the trouble to ascertain what his predecessors have already made known, he would have largely altered his notes.

The author as a sportsman and naturalist displays himself in a more favourable light than as a logician and observer. His sporting memoranda are amusing, and give a character to the volume, while as an amateur naturalist he shows more than average knowledge, and contributes some interesting facts on the subject of the animal kingdom. In the flora he is on less secure ground, and on one occasion, at page 137, confuses, in name at least, two such well known trees as the Hinoki (*Retinospora obtusa*) and the *Cryptomeria Japonica*.

In his remarks upon the people he bears good witness to the simplicity and kindness of the peasantry, of whom he must have seen a good deal. Unfortunately, for a traveller unlearned in the language, and chiefly dependent for his entertainment upon ordinary tea-houses, he has rather rashly ventured into generalisations requiring information that very few foreigners possess. At page 182 the Japanese men, as a race, are said to be "well made, muscular, active, and strong, and averaging about five feet five inches[1] in height," a description applying fairly well to the northern fishermen, but certainly flattering to the nation in general. Again, in several places the author follows a common fashion in deploring the evils brought upon the people by European "civilisation," but makes no allusion to the greater evils it is now expelling, and ignores the fact that any deterioration which has followed the recent change of circumstances is not the work of "civilisation," but of the vile or foolish camp-followers that may cling to the skirts of even the noblest army.

---

[1] Dr. Rein's estimate of the average height of the men is [illegible] centimetres. This is nearly as much below the mark as Capt. St. John's calculation is above it.

Upon the religion of the country he says little more than is to be found in a footnote at page 127; but students may be interested to learn from this that "Shinto is never represented by any figure, but worshipped as the Unseen Spirit which pervades everything. Buddha, as is well known, is always represented by a male figure; Shinto, the unrepresented, is supposed to be a female."

Criticism of the volume is to some extent disarmed by the modesty of its preface, and it no doubt contains much that will amuse the general reader.

In Dr. Rein's "Japan" we have the work not only of a *savant* thoroughly versed in his subject, but of a practised literary architect. The present volume deals with the geographical conformation, climate, flora, and fauna of the Japanese group, and the history, ethnography, and religion of the people, concluding with a useful chapter on topography. A future volume is to comprise an account of the industries and commerce, and will be welcomed by all who read the part now before us.

The geographical summary is far more complete and accurate than any to which the public has yet had access, and at every page shows the hand of an expert who has brought original knowledge and personal observation to bear upon his task. The climatic peculiarities are for the first time (save by the author himself in 1876) systematically described, and all the more important meteorological details accumulated in the past eighteen years in different parts of the country are reproduced in tabular form.

In the study of the flora and fauna the accumulation of facts is already too large to allow the author to go far beyond the limits of enumeration. Since Dr. Rein's account has been written a new addition has been made to the fauna in a catalogue of the birds of Japan by Capt. Blakiston and Mr. Pryer, and the number of known species raised from about 250 to 325, of which about 180 occur also in China, and about 100 are represented in Great Britain.

It is to be regretted that space could not have been spared for a little supplementary information upon some of those members of the animal kingdom which possess a more popular interest. For example, a few details respecting the dangerous and unpleasantly common *Mamushi* (*Trigonocephalus Blomhoffii*) and the wrongly maligned little *Hibakari* (*Tropidonotus Martensii*) would have been useful. The poisonous properties of certain species of the *Fugu* or genus *Tetrodon* are pointed out, and the symptoms produced by their use as food described; but in the reference to the "*hungerige, blutgierige Mosquitos*," though feeling tribute is paid to the vexatious side of their character, the grave charges to which they are open are omitted, their probable agency, long recognised by native physicians, in the conveyance of malignant pustule, and the suspicion raised by Dr. Patrick Manson's investigations in Amoy, that the spread of Elephantiasis Arabum in the south of Japan is due to the same pest.

The second and less technical part of the book embraces subjects upon which the author is less able to speak *in verbâ magistri* than on geographical science. The section, "Das Japanische Volk," opens with an historical abstract of about 200 pages, compiled from Klaproth, Kæmpfer, Siebold, Satow, Aston, and other authorities. The purely mythical stories of the age of the gods are passed over rapidly, and the commencement of the history of the country is fixed at the reign of Jimmu Tenno (660 to 585 B.C.). Dr. Rein is generous enough to acknowledge without question the reputed founder of the imperial lore, of whose existence there is little more proof than of that of the *Uwabami* and *Kamaitachi*, which the Professor does not consider entitled to a place in the fauna. As is mentioned in a footnote, the earliest written records extant originated in the first part of the eighth century of our era, and admitting the possibility that these were compiled from lost manuscripts of older date, they still offer satisfactory internal evidence that the historical being of Japan is at least a thousand years younger than is indicated by the list of the ancient emperors from whom the reigning Mikado traces his descent. The fact will perhaps be sufficiently demonstrated by a citation of the ages attributed to certain of the primitive rulers. The inaugurative myth, Jimmu Tenno, is said to have lived 127 years; Koan, the sixth Mikado, 137 years; Nintoku, the seventeenth Mikado (D. 399 A.D.), 122 years; and it is not until the fifth century A.D. that the viability of the rulers appears to have become permanently limited to a reasonable degree. It is true that the birth and death of Jimmu are solemnised as national festivals, and that writers on such sober topics as the industrial arts do not hesitate to refer for their landmarks to periods long antedating the true historical period; but all allowance must be made for inherited credulity in ancient traditions, which here form part of a state religion and establish the very sanctity of the throne.

We are glad to see that Dr. Rein does not altogether reject the romantic episodes of Japanese history. Awaiting the advent of a native Walpole to bruise the simple faith of his countrymen with historic doubts, it is a grateful relief to the tedium of the long series of wars and court intrigues that form the burden of the rather monotonous recitative of the Oriental Clio, to dwell for a moment on such stories as those of the gentle wife of Yamato Dake, who cast herself into the sea to propitiate the angry gods that threatened the safety of her husband's ship; of Kesa, who sacrificed her life to preserve her wifely fidelity; and many others of the number that have lent inspiration to the pencils of Hokusai, Yosai, and a hundred lesser artists. They are probably no more apocryphal than many of the wearisome details through which the student of history must plod.

The title "Geschichte des Japanischen Volkes" adopted by the author is somewhat misplaced. The history is not that of the people but of their rulers, and it would have been well had the author given the section a better claim to the heading by interspersing the story of battle and murder by some account of the development of laws, literature, painting, the various industrial arts, and such important social ceremonies as those of the *Cha-no-yu*, which lose much of their significance when divorced from the general history of the empire.

The most valuable portion of the sketch to the foreign world is that relating to the pregnant events of the last twenty years. In the narration of occurrences which have compelled the foreign powers, and especially Great Britain, to join issue with the Japanese Government Dr. Rein displays an absence of partisanship quite novel to those experienced in the discussion of Anglo-Japanese politics. His review of the present position and future prospects of the nation is thoughtfully cautious, and while drawing attention to the recent educational studies and the many wise acts of the present Government, shows a dark reverse to the picture in the financial difficulties now threatening serious obstruction to the path of improvement. The question of the opening of new ports or of the entire country to foreign enterprise and capital is also considered, and the writer points out the deadlock created on the one side by the great disadvantages which the Japanese foresee in admitting to competition an infinitely stronger commercial race, over whose actions they can have no judicial control, and on the other by the inexpediency, from the foreigners' point of view, of a surrender of the treaty rights while the laws and means of administration in Japan are in so unsatisfactory a condition as at the present time.

In an interesting chapter upon the Ethnography of the Japanese the author takes up the vexed problem of the origin of the now dominant race, who displaced the aboriginal Ainos. He believes, from considerations of speech, physiognomy, and traditions that they are a branch of the old Altaic family, which spread from its birthplace in all directions over the continent of Asia, some reaching Japan *viâ* Tsushima, Iki, and Oki, others settling at various parts of the mainland to form the Korean, Mandschurian, and other kindred people. In this view he is supported to some extent by the physiognomical identity with the Japanese of the yet pure descendants of the Korean potters brought over as trophies of Taiko's victorious arms at the end of the sixteenth century, and established in the province of Satsuma. Mr. Aston's researches into the comparative philology of the Japanese and Korean languages (*Trans.* Royal Asiatic Society, 1879) tend to a similar conclusion, but leave the question still open.

The analyses of literature, language, and religion are necessarily incomplete, but awaiting the further progress of the labours of the scholars now engaged in the study of these special branches, Dr. Rein's summary of the present knowledge will be of great service.

The author's views as to the character of the Japanese as a race are neither romantically favourable, like those of the great majority of travellers, nor unjustly contemptuous, like the convictions cherished by nearly all settlers. The national defects Dr. Rein considers to be a greed for novelty and a lack of stability and perseverance; but although this verdict would appear to be sanctioned by recent experience, the history of the country really points to nothing less than instability. A blind admiration for antiquity and a persevering if not energetic industry has characterised nearly the whole of their older manufactures and artistic productions, and the many centuries of persistence in the path opened by their forefathers were terminated only by a sudden change of circumstances, and an entirely forced and unsought relationship with the outer world. They are now learning an entirely new exercise of their powers, and some clumsiness at the outset is inevitable, while the very impetuosity of their progression necessarily brings their faults more easily within the scope of a passing glance. They have now bought experience, and until the world sees how they can utilise their expensive purchase any judgment is premature. They have indeed two serious drawbacks, poverty of material resources, and a written language that isolates them from the European world, and imposes serious limitations upon the interchange of the higher order of ideas amongst themselves; but the present generation can scarcely be blamed for either evil. If there be a charge in the past and present to which they are fairly open it is defect of invention, for as their recent knowledge is taken from Europe, so in former times were they indebted to the Asiatic continent for literature, arts, religion, and laws, as well as for a thousand smaller traits of civilisation, some of which they have preserved longer or better than their teachers.

Whatever dispraise is laid upon the people, nearly all writers agree to credit them with remarkable cleanliness. Miss Bird, however, who has studied Japan under a new aspect, gives a different testimony as to the interior, and the few travellers who have caught a glimpse of the unbeaten tracks of the great cities might make strange revelations. As the better class European generally knows little or nothing of the secrets of his own metropolitan slums, it is conceivable that a foreigner living in Tokio may not be aware that it contains other habitations than those he passes in the public thoroughfares; but were curiosity or chance to lead him to thread some of the little, hardly noticeable, inlets which here and there break the line of the street dwellings he would be startled by the new world revealed to him—one where the hundreds of thousands of poor of the great city live, densely packed in filth and disease, in dilapidated dens with crumbling walls and roofs that would render needless the spell of Asmodeus to the Don Cleofas who cares to peer at the miseries only half concealed by the long lines of sheds, moated with foul stagnant drains, flanked by reeking accumulations of sewage and garbage, and cut off from ventilating breezes by the dwellings of the more fortunate but less numerous citizens. Had Dr. Rein extended his pilgrimage to the *Uradana* he would have written a new and curious chapter.

As regards bathing, it is certainly a common custom, but with the poorer classes it is far less frequent than travellers would lead us to believe. It is moreover not so much dictated by any unconquerable intolerance of dirt as by the combined attractions of warm water and neighbourly gossip. Whatever purification may be derived from the common use of a limited quantity of water by several dozens of people, it is doubtful whether we may not take as a set-off the odoriferous condition of the unwashed winter garments which often do unrelieved duty day and night for the whole season, and the very scant attention that the native feels impelled to bestow upon his hands and face in the intervals of his visits to the bathing-house. These remarks however do not imply that the working orders in Japan compare unfavourably in respect to physical purity with their European brethren.

The maps and illustrations are excellent in choice and execution. One error must however be indicated in the woodcut described as a "*Riu-kiu-Insulander*," which is really an accurate portrait of the Korean envoy who visited Japan in 1877.

It is impossible to do justice to Dr. Rein's important book in the space at our command. Its construction is eminently scientific, and its thoroughness will excite the admiration of all who know the difficulty of obtaining, and especially of selecting, information upon many of the matters so exhaustively treated. The errors are few and seldom important, and will probably disappear in the next edition. One powerful recommendation is the absence of the *ego* from its pages; the author everywhere studiously keeps his own individuality concealed, and in the discussion of most points he is nearly always contented with such a statement and grouping of the principal facts as will leave the inference well within the grasp of the reader's mind. In conclusion, it is the best of the many publications upon the subject of Japan that have appeared in the last ten years, and, unlike most of the number, supplies a real want, and will be received gratefully by all who seek for solid, trustworthy information. We trust that the completion of the work will soon be issued.

OUR BOOK SHELF

Études géométriques et cinématiques. Note sur quelques Questions de Géométrie et de Cinématique, et Réponse aux Réclamations de M. l'Abbé Aoust. Par E. J. Habich. 80 pp. (Lima, 1880.)

M. L'ABBÉ AOUST, author of the "Analyse infinitésimale des Courbes planes," and our author put forward conflicting claims as to priority of discovery.

The polemics have fired off their powder in *Les Mondes* (tome iv., 1880, Aout: tome l., 1879, Habich; see also the *Comptes rendus*, lxxxv., 1877, and lxxxix., 1879), and the object of the present pamphlet is "de réduire à leur juste valeur les assertions" of the Abbé. The matters in dispute can be inferred from the three divisions of the present work:—

"1. Développoïdes—considérations historiques, étude des enveloppes des droites par la considération du centre instantané de rotation, développoïdes des divers ordres et devellopoïdes inverses.

"2. Coordonnées tangentielles-polaires.

"3. Mouvement géométrique d'une figure plane dans son plan—considérations générales, mouvement géométrique déterminé par deux systèmes d'enveloppées et d'enveloppes, mouvement d'une droit sur un plan."

We have, of course, but one side of the quarrel presented to us, but leaving polemics on one side there is a great deal of interesting matter put before us. Time will, no doubt, settle the question of priority.

A Synopsis of Elementary Results in Pure and Applied Mathematics. By G. S. Carr, B.A. Vol. i. part viii. (C. F. Hodgson and Son, 1880.)

WE recently noticed with approval the volume containing the first seven parts. This eighth part carries on the articles from 1400 to 1868, and is concerned with the differential calculus. It contains an abstract of the usual processes, and besides gives a succinct account of the theory of operations, and an analysis of matters which are treated of in the higher algebra, as Jacobians and quantics, and closes with maxima and minima, the geometrical applications being reserved for the parts on Co-ordinate Geometry.

These fifty-six pages are very correctly printed, at least we have not detected more than three or four trivial typographical errors.

This part maintains the handy character for reference of its forerunners.

The Practical Fisherman. By T. H. Keene. (London: *The Bazaar* Office.)

THIS book deals with the natural history, the legendary lore, and the capture of British freshwater fish, together with the art of tackle-making. The author has bestowed great care on his work, and seems to have studied every book written or published on the charming subject from Oppian to the present time. Mr. Keene is besides an enthusiastic fisherman, and has thus produced a treatise of great interest to the practical angler. We may add that this work is almost the only one on angling which treats of the natural as well as the traditional history of fishes.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

The Movements of Leaves

FRITZ MUELLER has sent me some additional observations on the movements of leaves, when exposed to a bright light. Such movements seem to be as well developed and as diversified under the bright sun of Brazil, as are the well-known sleep or nyctitropic movements of plants in all parts of the world. This result has interested me much, as I long doubted whether paraheliotropic movements were common enough to deserve to be separately designated. It is a remarkable fact that in certain species these movements closely resemble the sleep movements of allied forms. Thus the leaflets of one of the Brazilian Cassiæ assume when exposed to sunshine nearly the same position as those of the not distantly allied Hæmatoxylon when asleep, as shown in Fig. 153 of "The Movements of Plants." Whereas the leaflets of this Cassia sleep by moving down and rotating on their axes, in the same peculiar manner as in so many other species of the genus. Again, with an unnamed species of Phyllanthus, the leaves move forwards at night, so that their midribs then stand nearly parallel to the horizontal branches from which they spring; but when they are exposed to bright sunshine they rise up vertically, and their upper surfaces come into contact, as they are opposite. Now this is the position which the leaves of another species, namely *Phyllanthus compressus*, assume when they go to sleep at night. Fritz Müller states that the paraheliotropic movements of the leaves of a Mucuna, a large twining Papilionaceous plant, are strange and inexplicable; the leaflets sleep by hanging vertically down, but under bright sunshine the petiole rises vertically up, and the terminal leaflet rotates by means of its pulvinus through an angle of 180°, and thus its upper surface stands on the same side with the lower surfaces of the lateral leaflets. Fritz Müller adds, "I do not understand the meaning of this rotation of the terminal leaflet, as even without such a movement it would be apparently equally well protected against the rays of the sun. The leaflets, also, on many of the leaves on the same plant assume various other strange positions." With one species of Desmodium, presently to be mentioned as sleeping in a remarkable manner, the leaflets rise up vertically when exposed to bright sunshine, and the upper surfaces of the lateral leaflets are thus brought into contact. The leaves of *Bauhinia grandiflora* go to sleep at an unusually early hour in the evening, and in the manner described at p. 373 of "The Movements of Plants," namely, by the two halves of the same leaf rising up and coming into close contact: now the leaves of *Bauhinia Brasiliensis* do not sleep, as far as Fritz Müller has seen, but they are very sensitive to a bright light, and when thus exposed the two halves rise up and stand at 45° or upwards above the horizon.

Fritz Muller has sent me some cases, in addition to those given in my former letter of March 3, of the leaves of closely-allied plants which assume a vertical position at night by widely different movements; and these cases are of interest as indicating that sleep-movements have been acquired for a special purpose. We have just seen that of two species of Bauhinia the leaves of one sleep conspicuously, while those of a second species apparently do not sleep at all. The leaves of *Euphorbia jacquiniæflora* depend vertically at night, whereas those of a dwarfish Brazilian species rise vertically up at night. The leaves of this Euphorbia stand opposite one another—a position which is rather rare in the genus; and the rising movement may be of service to the plant, as the upper surfaces of the opposite leaves mutually protect one another by coming into contact. In the genus Sida the leaves of two species rise, while those of a third Brazilian species sink vertically down at night. Two species of Desmodium are common plants near Fritz Müller's house: in one the leaflets move simply downwards at night; but in the other not only do the three leaflets move vertically down, while the main petiole rises vertically up, as is likewise the case with *D. gyrans*, but in addition the lateral leaflets rotate so as to stand parallel with the terminal leaflet, behind which they are more or less completely hidden. This, as far as I have seen, is a new kind of nyctitropic movement; but it leads to a result common to several species, namely, that of packing the three leaflets closely together and placing them in a vertical position.

Down, Beckenham, Kent, April 14 CHARLES DARWIN

Spectrum of the Star Ll. 13412

THE spectrum of the star Ll. 13412 appears to be in some respects unique. It consists mainly of three bright lines having wave-lengths of 545, 486, and 466 millionths of a millimetre. Four other stars have hitherto been found whose spectra are of this character. Three of them are in Cygnus, and have lines whose wave-lengths are 580, 568, 536, and 467. The fourth star, Oeltzen 17681, has lines at about 582 and 470 (NATURE, vol. xxii. p. 483). The line or band at 467 appears to be common to all, and that at 580 to the last four. The line at 486 in Ll. 13412 coincides with the F line of hydrogen, but is not visible in the other stars. The line at 545 is also absent in them. This star therefore appears to resemble the others in kind, but not in the material of which it is composed. It is also much brighter than the others, so that it is not a difficult object with a small telescope. Its position for 1880 is in R.A. 6h. 49·3m. and Dec. −23° 47′. It is easily found as a seventh magnitude star about 15′ north of σ *Canis Majoris*.

Cambridge, U.S., April 14 EDWARD C. PICKERING

The Indian Winter Rains

IN NATURE, vol. xxiii. p. 400, Mr. F. Chambers very properly points out that the winter rains of Northern India, though usually heaviest in years when the mean pressure is above the average, are yet coincident with short periods of low rather than of high pressure. The way in which Mr. Chambers accounts for the low pressure seems, however, rather far-fetched. It is true that on one or two of the American weather charts storm tracks are shown extending from the Mediterranean to Northern India or the Bay of Bengal, but these paths are drawn with dotted lines indicating that they are doubtful, and, considering the absence of meteorological stations in the greater part of the area between the Mediterranean and India, and the nature of the intervening country—especially Afghanistan with its high mountains—I should say the evidence upon the strength of which the American chartographer laid down these storm tracks, was of the slightest possible description. The winter rains are however accompanied by a cyclonic movement of the air over Northern India, and I wish to point out that, whether the cyclonic disturbance be a European or Transatlantic visitor, as Mr. Chambers supposes, or a native of the Indian region, generated by the rainfall, as Mr. Eliot has taught in his report for 1877, the "old notion" of the connection of the rains with the upper anti-monsoon current is by no means exploded. The progress of the disturbance and of the rainfall is usually from north-west to south-east, and the rainfall is heaviest, as a rule, on the eastern side of the disturbance. The winds which bring the rainfall therefore come from some southerly quarter, and as northerly winds generally continue blowing in the extreme south of India at the time when these disturbances occur in the north, the southerly rainy winds must be derived from an upper current which descends in the anti-cyclone or region of high pressure in the centre and south of India, or in the zone between the south of India and the equator. Mr. Blanford's modification of his former views regarding the origin of these rains appears from his remarks and the accompanying charts in the Meteorological Report for 1878 to be merely that the indraught towards the region of precipitation is not confined to Northern India, but is occasionally, though rarely, felt as far south as Ceylon.

In a letter of mine that appeared in NATURE for the following week (p. 409), there was a mistaken inference from Mr. Blanford's investigation regarding the "Barometric See-saw" between India and West Siberia that I beg your permission to correct. The mean pressure at sea-level in the Indo-Malayan and West Siberian regions appears from Mr. Buchan's charts to be nearly the same both on the average of the year and in January and July. Also no wind blows directly from the one region to the other. We cannot therefore infer anything regarding the strength of the winds from Mr. Blanford's results, but we may regarding temperature. The proper inferences of this kind from the results arrived at by Mr. Blanford and Mr. Archibald appear to be these:—(1) The range of temperature in the 11-year period is greater in Siberia than in surrounding countries; (2) Siberia is coldest, compared with neighbouring countries, at times of maximum sun-spot; (3) This relation is most marked in winter; and (4) near the coasts of the Pacific (Nertchinsk, Pekin, Zi-ka-wei), the Indian (all the Indo-Malayan stations, especially those nearest the sea), and the Atlantic (London) oceans, where presumably the range of temperature is less than in the heart of the continent, the variation of the barometer in the 11-year period is opposite to that observed in Siberia. Allahabad, March 29

Palæolithic Man

IT is desirable that further search should be made for implements made by man in the deposits of this country assumed to be older than the well-known and accepted implementiferous river-gravels.

In the gravels belonging to the Thames, in and near London, palæolithic implements are of not infrequent occurrence. In my own collection I have more than 120 examples—with few exceptions found by myself—and I know of at least another hundred specimens found chiefly by London friends who have availed themselves of hints given by me.

My object now is to direct attention to the fact that the implements are not only found in and near London in the lower and middle terraces of gravel some 25 to 70 feet above the ordnance datum, but at far greater heights. Some of these heights near London may, and others no doubt do, belong to the Thames or to its tributaries, but they all (in different degrees) appear to point to a more remote time than the period when the lower terraces of the Thames and its tributaries were formed. Some of the implements now found in the lower gravels are clearly "derived" from more ancient deposits. For instance, I have one example white in colour and highly porcellaneous:—the white colour has been brought about by the decomposition of the flint in some ancient loam or clay, and not from the gravel in which the implement was found: this is proved by several more or less highly-polished accidental fractures at the edges of a different colour from the general white surface: these coloured fractures are more recent than the white facets, and date from the last deposition of the implement in the lower terrace: the white abraded flakings belong to a highly remote time. Dr. John Evans records the finding of an implement in the Thames gravel at Highbury, at 102 feet, whilst I have found one (also near Highbury), at an elevation of 144 feet. Last summer I found an implement on the eminence at the north of, and overlooking Ealing Dean, at a height of 164 feet. This is 72 feet higher than the implementiferous beds of Ealing Dean described by General Pitt Rivers, and between 80 and 100 feet higher (in one instance 104 feet higher) than the implement-bearing gravels at Acton described by the same gentleman. The gravel at the 164-feet elevation forms an isolated patch on the extreme top of a hill. I watched the excavations here (which were shallow) for road-making, with great care, and with the implement I found several flakes. These heights agree well with the heights of some of the implementiferous gravels found capping the cliffs in the South of England, also with the Erith position at Northumberland Heath, where Mr. F. C. J. Spurrell found an implement at an elevation of 175 feet.

Most geologists know the high gravels overlooking Hertford, Ware, and Amwell; their altitude is from 130 to over 180 feet above the ordnance datum. Gravel from the two first of these places is brought to London for ballast in thousands of tons. A year or two ago great quantities of gravel from Hertford were brought to Finsbury Park by the Great Northern Railway, and in the gravel thrown down near Finsbury Park I picked up a good sub-triangular wedge-shaped implement. Further search produced a second implement, a good trimmed flake, and a few simple flakes. The worked flints in the Hertford gravel are however so rare that the search for them is the most hopeless task conceivable. There is not more than one flake in 500 tons, not one implement in 5000 tons of gravel. The gravel from Ware is also brought to the east of London for ballast, and I happened last year to mention the fact of my discoveries to Mr. J. E. Greenhill, the Principal of a school near Hackney Downs. Mr. Greenhill at once not only searched himself, but set his pupils to look over the Ware gravel, then laid down in large quantities near Clapton, with the result that a large broken ovate implement was found and several flakes. I also found a large and heavy "slice" flake with numerous facets on its worked side in the same gravel. Mr. Greenhill's success caused me to look carefully over a similar lot of gravel from Ware, laid down near Victoria Park. In this I found a sub-triangular implement and three flakes. I have also found a large greatly abraded flake in the Amwell gravel at Amwell. Elsewhere in east and north-east London I have looked over thousands of tons of Hertford and Ware gravel without decisive result. A week or two ago, however, as my younger son was returning home through Finsbury Park, he picked up a good scraper-like implement in the gravel (presumably from Hertford), just thrown on to the road inside the park. On hearing of the discovery I at once went to Finsbury Park and looked carefully over all the recently thrown down material, but with no further result. I have visited the different pits at Hertford, Ware, and Amwell several times, but there is never enough gravel exposed (considering the extreme comparative rarity of the implements and flakes) to give one a chance of finding an implement. I have found in the pits several simple flakes, with the cone of percussion, and that is all. At what depth the implements occur in the gravel I do not know, but that implements really do come out of the high gravels overlooking Hertford and Ware I think there can be no doubt. Reference was made by me to these implements at the Anthropological Institute three years ago, when two or three specimens were exhibited by me.

WORTHINGTON G. SMITH

125, Grosvenor Road, Highbury, N.

Sound of the Aurora

WITH every respect for the ability and acuteness of the late Sir John Franklin and his companions, I do not think it conclusive, as Mr. Rouse seems to do, that because they heard no sounds "with the aurora borealis" (NATURE, vol. xxiii. p. 556), no sounds are produced by it.

All Indians, both on the shores of Hudson's Bay and near Bear Lake, and the Eskimos on many parts of the coast, assert positively that the bright, varying, flickering,[1] and rapidly-moving auroræ do produce sound. The senses of hearing and smelling in the Indian and Eskimo are far more acute than in the civilised man; and both sounds and smells which to the latter are not perceptible are perfectly so to the more sensitive auditory and olfactory organs of the savage.

The theory that "the attractive force of the aurora is increased within a certain limit as its rays proceed southward" is scarcely borne out by my experience.

When wintering at Fort Hope, Repulse Bay, in 1846-47 and 1853-54, lat. 66° 32′ N., the result of my observations was, as far as I can discover, exactly similar to that of Parry in 1824-25 at Port Bowen in lat. 73° 15′ N., 400 miles further north and fifty miles west of Fort Hope: at both no effect was produced on the magnetic needle.

At Repulse Bay, and it may have been the same at Port Bowen, the character of the aurora was perfectly different from that generally seen at Great Bear Lake, which acted so powerfully on the needle, the former being almost always of a uniform pale yellow or straw colour, with little rapid motion, whereas the latter was generally flashing, flickering, rapidly moving, and of diverse hues.

One peculiarity of the auroræ observed at Repulse Bay may be worthy of notice: they were chiefly seen to the magnetic south—that is south 62° east true—usually in the form of an arch rather low down—and I may add that in that direction at a distance of thirty or forty miles from our head-quarters a large extent of sea is kept open all winter by strong currents. The Eskimos of Repulse Bay do not say much about the aurora beyond expressing a belief that it is the spirits of their dead visiting each other in the heavens.

It is probably a matter of little or no importance in a question of this kind, but Mr. Rouse has given the latitudes of the southern shores of Great Bear Lake from 90 to 200 miles too far north.

Fort Franklin, where Franklin made his chief observations, is situated in latitude 65° 12′ N. at the extreme south-west of Great Bear Lake, whereas Fort Confidence, where Sir J. Richardson and I made ours with like results, is at the extreme north-east of the lake in lat. 66° 54′ N., the stations being 150 miles distant from each other.

It is perhaps not being too sanguine to hope that in this period of marvellous discoveries, some instrument may be—if not already—invented, with the aid of which one may be able to decide the question satisfactorily as to whether the aurora in any form does or does not produce sound. JOHN RAE

THE SCIENTIFIC PRINCIPLES INVOLVED IN ELECTRIC LIGHTING[1]

II.

Lectures III. and IV.

ALL machines for the conversion of mechanical work into electricity are founded on Faraday's great discovery of the induced current derived from the relative motion of a magnet and a coil of wire. They are either continuous-current or alternate-current machines. From the continuous-current machines of Pixii in 1832 and Saxton and Clarke in 1835 and 1836, we pass to Wheatstone's introduction in 1845 of electromagnets in place of permanent magnets to produce the magnetic field. In 1854 Werner Siemens and Halske introduced the Siemens armature, in which the coil is wound longitudinally in a groove. In 1854 Hjorth patented an improved magneto-electric battery, in which the currents induced in the revolving armature pass round the electromagnets and produce the magnetic field. This is the principle of the dynamo-electric machine, which was afterwards rediscovered by Siemens and by Wheatstone simultaneously in 1867, when on the same evening their two papers were presented to the Royal Society.

Then followed the Gramme armature, in which coils of wire are wound in sections all in the same direction round a ring; each section, when a current is flowing through it, may be regarded as an electro-magnet, and its principle of action is clear at once from the principles of Arago and from Lenz's laws for induced currents.

In dynamo-electric machines the external work in the electric arc is proportional to the square of the current, and is also proportional to the number of turns of the armature per minute.

Any disturbance in the resistance of the arc reacts on the electro-magnet, altering the strength of the magnetic field, thereby increasing the disturbance; this is the great disadvantage of dynamo-electric machines as compared with magneto-electric machines, where the magnet is either a permanent magnet or is excited by means of a separate current. Wilde, in 1863, employed a separate continuous current machine to give a permanent magnetic field, and made the armature of the second machine to revolve in this magnetic field. In alternate-current machines there is no commutator for making the current continuous, but the currents from the coil are collected and sent through the external resistance in opposite directions for every half-turn of the armature. The Alliance magneto-electric machine was the first of these, which was converted by Holmes into a continuous-current machine, and was by him first used in 1858 to produce the electric light for lighthouse illumination. He afterwards again converted his machine into an alternate-current machine by removing the commutator, thereby producing a very effective machine.

---

[1] I borrow this most appropriate term from Prof. Stokes, F.R.S., &c., of Cambridge.

[1] By Prof W. Grylls Adams, F.R.S. Continued from p. 582.

All theoretical determinations of the efficiency of machines are complicated by the retardation of magnetisation of the magnets, which necessitates a change of position of the commutator or brushes in the direction of the rotation of the armature. The practical determinations of efficiency which have been made show that from 86 to 88 per cent. of the energy communicated to a dynamo-machine is converted into electrical energy, and that from 44 to about 50 per cent. of the total work may be converted into useful work in the external circuit. Among the more recent continuous current machines are the Brush and the Burgin machines, which promise to give good results.

At intervals during the lecture the room was lighted by various electric lamps, the peculiarities of each of which were explained. The Brockie lamp, lent by the British Electric Light Company, and served by one of their Gramme machines; the Siemens pendulum-lamp lent by Dr. Siemens, and the Crompton lamp lent by Mr. Crompton, were each tried in turn, and attention was drawn to the Siemens' differential lamp, the Brush lamp, and other lamps and electric candles which were also exhibited.

The subject of the fourth Cantor lecture was the subdivision of the electric current and lighting by incandescence. Prof. Adams showed that objections raised to the electric light were similar to those which had been urged with regard to gas when it was first introduced. He then compared the energy of Grove's cells with the energy derived from a small Gramme machine, and showed how impracticable it was to attempt to do by means of batteries the work which can be done by such machines. He then explained how the same amount of energy might be spent in two classes of machines, those of low internal resistance and low electromotive force which send a strong current through small external resistance, or quantity machines, and those of high internal resistance and high electromotive force sending a smaller current through large external resistance, or tension-machines. For very high resistances the discharge of an induction-coil is taken, the action of which was compared to the action of the hydraulic ram. Prof. Adams proceeded to describe the Werdermann and the Joel lamps, and explained the kind of machine specially suited for such lamps, and regretted that it would not be possible to show them to the best advantage, or to give them a fair trial, because the machine actually in use at the speed at which it was running was not adapted for them. An electromotive force of 130 volts will send 50 webers through 10 lamps in series, and give an illumination of 320 candles in each lamp for an expenditure about 10 h.p. Taking Mr. A. Siemens' facts as to the cost, it appears that the electric light from the Joel lamp would be as cheap as gas at the rate of 2*s.* per 1000 cubic feet. The laws of the subdivision of the electric current were discussed, and their application to the system of incandescent lighting adopted by Swan, and by Lane-Fox and Edison was clearly shown. With the Bürgin machine, then in use, giving at 1620 revolutions a minute an electromotive force of 160 volts, and a current of 24 webers through an external resistance of about 7 ohms, it was shown that 24 rows of two Swan lamps in series or 48 lamps could be lit up: each lamp being of 80 ohms resistance, and giving a 48 candle-power light. If the resistance of each lamp be 40 instead of 80 ohms, then double the number of lamps might be taken in series, giving about 100 lamps from the machine.

With the Brush machine at least 140 lamps might be lit up in 10 parallel rows of 14 lamps in series. The early attempts of King, and Staite, and Konn to light by incandescence were then explained, and experiments made to illustrate the phenomena seen in high vacua, such as are necessary to enable Mr. Swan and Mr. Lane Fox to preserve their carbons from wasting when rendered incandescent by means of the electric current.

The room was well lighted by means of 20 Swan lamps, each giving a pleasant and steady light of about 40 or 50 candle-power, the lamps being arranged in 10 rows of two in series. Two table-lamps were placed on the lecture-table, which could be put out separately or made to glow at pleasure, and these lamps could be lifted off their stands and others put in their places without disturbing other lights which were arranged in multiple arc and worked from the same dynamo-machine.

THE FRENCH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE AT ALGIERS[1]

II.

Algiers, April 17

On Friday afternoon various papers on local subjects were read to a general audience in the *foyer* of the theatre. They related to the geology, geography, and demography of Algeria, but the most interesting paper was by our Consul-General, Col. Playfair, on a visit to the country of the Kroumirs—interesting not only because the aggressions of this tribe have led to the present complications in Tunis, which will probably end in war, but also because Col. Playfair and Lord Kingston are the only Europeans who have visited their country. They inhabit the district near Le Calle, that is to say, the northern portion of the boundary between Algeria and Tunis, and they only nominally acknowledge the suzerainty of the Bey of Tunis.

On Friday evening a discourse was delivered in the theatre "On Paludisme from a Surgical Point of View." It was of such a very technical character that many members of the Association did not attend. In fact the Congress is to a great extent medical. While the Physical and Botanical Sections are positively languishing for want of papers, and will probably come to a premature ending on Monday, the papers waiting to be read before the Medical Section fill two pages of yesterday's programme.

More activity was manifested in the sectional work on the second day of the Congress; the papers in most of the sections were more numerous and the audiences larger. The physical section is the most neglected of all. Long after the proper time of commencement the president had not made his appearance, and at length Mr. Siemens, the only honorary vice-president, was requested to take the chair. Of the four papers read three were by Englishmen, and on the first day of meeting one paper alone was read by a Dutchman. Pure physics in France is unfortunately quite unrepresented at the Congress. In the Chemical Section M. Baunhauer read a paper "On the Crystallisation of the Diamond," and M. de Foreland "On a New Apparatus for Gas Analysis." There were several good papers on meteorological subjects. Only three papers were read in the Geological Section, the most important of these by M. Villanova, "On the Unification of Geological Nomenclature." The Anthropological Section was well attended, and papers of considerable local interest were read. The Sections of Geography and Political Economy mainly discussed the Sahara—on the one hand its physical geography, and on the other its colonisation.

In the Agricultural Exhibition one of the most interesting machines is the solar engine, the boiler of which is placed in the axis of a mirror 14 feet in diameter, and formed of three portions of hollow truncated cones, so as to get a close approximation to the parabola. When the sun shines a pressure of from three to four atmospheres is produced in the boiler, and a force of one-horse power is produced through the intervention of an ordinary steam-engine. The mirror is of silvered copper; the boiler is blackened and is surrounded by a glass cylinder, which, of course permits the passage of the sun's heat through it, but obstructs its escape after absorption. The whole thing costs 4000 francs, and it could be used in many countries for at least 200 days in the year.

---

[1] Continued from p. 582.

G. F. RODWELL

THE HERRING[1]

IT is now nineteen years since my attention was first specially directed to the natural history of the herring, and to the many important economical and legal questions connected with the herring fisheries. As a member of two successive Royal Commissions, it fell to my lot to take part in inquiries held at every important fishing station in the United Kingdom between the years 1862 and 1865, and to hear all that practical fishermen had to tell about the matter; while I had free access to the official records of the Fishery Boards. Nor did I neglect such opportunities as presented themselves of studying the fish itself, and of determining the scientific value of the terms by which, in the language of fishermen, the various conditions of the herring are distinguished.

Diligent sifting of the body of evidence thus collected and passed under review, led to the satisfactory clearing away in my own mind of some of the obscurities which, at that time, surrounded the natural history of the fish. But many problems remained, the solution of which was not practicable by investigations which, after all, were only incidents in the course of a large inquiry, embracing a vast number of topics beside herrings and herring fisheries; and it is only within the last few years that the labours of the German West Baltic Fishery Commission have made such large additions to the state of our knowledge in 1865, that the history of the herring is brought within measurable distance of completeness.

Considering the vast importance of the herring fisheries of the Eastern Counties, it occurred to me when the President of the National Fishery Exhibition did me the honour to ask me to address you, that nothing could be more likely to interest my audience than a summary statement of what is now really known about a fish which, from a fisherman's point of view, is probably the chief of fishes.

I am aware that I may lay myself open to the application of the proverb about carrying coals to Newcastle, if I commence my observations with a description of the most important distinctive characters of a fish which is so familiar to the majority of my hearers. And perhaps it is as well that I should at once express my belief that most of you are as little likely to mistake a herring for anything else as I am. Nay, I will go further. I have reason to believe that any herring-merchant, in a large way of business, who may be here, knows these fish so much better than I do, that he is able to discriminate a Yarmouth herring from a Scotch herring and both from a Norway herring; a feat which I could not undertake to perform. But then it is possible that I may know some things that he does not. He is very unlike other fishermen and fish-merchants with whom I have met, if he has any but the vaguest notions of the way of life of the fish; or if he has heard anything about those singularities of its organisation which perplex biologists; or if he can say exactly how and why he knows that a herring is not a sprat, a shad, or a pilchard. And all kinds of real knowledge and insight into the facts of nature do so bear upon one another and turn out in strange ways practically helpful, that I propose to pour out my scientific budget, in the hope that something more may come of it than the gratification of intelligent curiosity.

If any one wants to exemplify the meaning of the word "fish" he cannot choose a better animal than a herring. The body, tapering to each end, is covered with thin, flexible scales, which are very easily rubbed off. The taper head, with its underhung jaw is smooth and scaleless on the top; the large eye is partly covered by two folds of transparent skin, like eyelids—only immovable and with the slit between them vertical instead of horizontal; the cleft behind the gill cover is very wide, and, when the cover is raised, the large red gills which lie beneath it are freely exposed. The rounded back bears the single moderately long dorsal fin about its middle. The tail fin is deeply cleft, and on careful inspection small scales are seen to be continued from the body, on to both its upper and its lower lobes, but there is no longitudinal scaly fold on either of these. The belly comes to an edge, covered by a series of sharply-keeled bony shields between the throat and the vent; and behind the last is the anal fin, which is of the same length as the dorsal fin. There is a pair of fore-limbs, or pectoral fins, just behind the head; and a pair of hind-limbs, or ventral fins, are situated beneath the dorsal fin, a little behind a vertical line drawn from its front edge, and a long way in front of the vent. These fins have bony supports or rays, all of which are soft and jointed.

Like most fishes, the herring is propelled chiefly by the sculling action of the tail-fin, the rest serving chiefly to preserve the balance of the body, and to keep it from turning over, as it would do if left to itself, the back being the heaviest part of the fish.

The mouth of the herring is not very large, the gape extending back only to beneath the middle of the eye, and the teeth on the upper and lower jaws are so small as to be hardly visible. Moreover, when a live herring opens its mouth, or when the lower jaw of a dead herring is depressed artificially, the upper jaw, instead of remaining fixed and stationary, travels downwards and forwards in such a manner as to guard the sides of the gape. This movement is the result of a curious mechanical arrangement by which the lower jaw pulls upon the upper, and I suspect that it is useful in guarding the sides of the gape when the fish gulps the small living prey upon which it feeds.

The only conspicuous teeth, and they are very small, are disposed in an elongated patch upon the tongue, and in another such patch, opposite to these, on the fore part of the roof of the mouth. The latter are attached to a bone called the vomer, and are hence termed vomerine teeth. But, if the mouth of a herring is opened widely, there will be seen, on each side, a great number of fine, long, bristle-like processes, the pointed ends of which project forwards. These are what are termed the gill rakers, inasmuch as they are fixed, like the teeth of a rake, to the inner sides of those arches of bone on the outer sides of which the gills are fixed. The sides of the throat of a herring, in fact, are as it were cut by four deep and wide clefts which are separated by these gill arches, and the water which the fish constantly gulps in by the mouth flows through these clefts, over the gills and out beneath the gill covers, aërating the blood, and thus effecting respiration, as it goes. But since it would be highly inconvenient, and indeed injurious, were the food to slip out in the same way, these gill rakers play the part of a fine sieve, which lets the water strain off, while it keeps the food in. The gill rakers of the front arches are much longer than those of the hinder arches, and as each is stiffened by a thread of bone developed in its interior, while, at the same time, its sides are beset with fine sharp teeth, like thorns on a brier, I *suspect* that they play some part in crushing the life out of the small animals on which the herrings prey.

Between these arches there is, in the middle line, an opening which leads into the gullet. This passes back into a curious conical sac which is commonly termed the stomach, but which has more the character of a crop.

---

[1] A lecture delivered by Prof. Huxley at the National Fishery Exhibition, Norwich, April 21, 1881.

Coming off from the under side of the sac and communicating with it by a narrow opening, there is an elongated tubular organ, the walls of which are so thick and muscular that it might almost be compared to a gizzard. It is directed forwards, and opens by a narrow prominent aperture into the intestine, which runs straight back to the vent. Attached to the commencement of the intestine, there is a score or more of larger and shorter tubular organs which are called the pyloric cæca. These open into the intestine, and their apertures may be seen on one side of it, occupying an oval space, in the middle of which they are arranged three in a row.

The chief food of the herring consists of minute Crustacea, some of them allied to the shrimps and prawns, but the majority belonging to the same division as the common *Cyclops* of our fresh waters. These tenant many parts of the ocean in such prodigious masses that the water is discoloured by them for miles together, and every sweep of a fine net brings up its tens of thousands.

Everybody must have noticed the silvery air-bladder of the herring, which lies immediately under the backbone, and stretches from close to the head to very near the vent, being wide in the middle and tapering off to each end. In its natural state, it is distended with air; and, if it is pricked, the elastic wall shrinks and drives the air out, as if it were an indiarubber ball. When the connexions of this air-bladder are fully explored it turns out to be one of the most curious parts of the organisation of the whole animal.

In the first place, the pointed end of the sac or crop into which the gullet is continued runs back into a very slender duct which turns upwards and eventually opens into the middle of the air-bladder. The canal of this duct is so very small and irregularly twisted, that, even if the air-bladder is squeezed, the air does not escape into the sac. But, if air is forced into the sac by means of a blowpipe, the air passes without much difficulty the other way, and the air-bladder becomes fully distended. When the pressure is removed, however, the air-bladder diminishes in size to a certain extent, showing that the air escapes somewhere. And if the blowing up of the air-bladder is performed while the fish is under water, a fine stream of air-bubbles may be seen to escape close to the vent. Careful anatomical investigation, in fact, shows that the air-bladder does not really end at the point where its silvery coat finishes, but that a delicate tube is continued thence to the left side of the vent, and there ends by an opening of its own.

Now the air-bladder of all fishes is, to begin with, an outgrowth from the front part of the alimentary canal, and there are a great many fishes in which, as in the herring, it remains throughout life in permanent communication with the gullet. But it is rare to find the duct so far back as in the herring; and, at present, I am not aware that the air-bladder opens externally in any fishes except the herring and a few of its allies.

There is a general agreement among fishermen that herrings sometimes make a squeaking noise when they are freshly taken out of the water. I have never heard this sound myself, but there is so much concurrent testimony to the fact that I do not doubt it; and it occurs to me that it may be produced when the herrings are quickly brought up from some depth by means of this arrangement. For under these circumstances the air, which the air-bladder contains, expands to such a degree, on being relieved from the pressure of the water, that deep-sea fishes with a closed air-bladder which are brought to the surface rapidly are sometimes fairly turned inside out by the immense distension, or even bursting, of the air-bladder. If the same thing should happen to the herring the like misfortune would not befall it, for the air would be forced out of the opening in question, and might readily enough produce the squeak which is reported. The common Loach[1] is said to produce a piping sound by expelling the air which this fish takes into its intestine for respiratory purposes.

At the opposite end of the air-bladder there is an even more curious arrangement. The silvery coat of the air-bladder ends in front just behind the head. But the air-bladder itself does not terminate here. Two very fine canals, each of which is not more than a two-hundredth of an inch in diameter, though it is surrounded by a relatively thick wall of cartilage, pass forward, one on each side, from the air-bladder to the back of the skull. The canals enter the walls of the skull, and then each divides into two branches. Finally, each of these two dilates into a bag which lies in a spheroidal chamber of corresponding size and form; and, in consequence of the air which they contain, these bags may be seen readily enough shining through the side walls of the skull, the bone of which has a peculiar structure where it surrounds them. Now these two bags, which constitute the termination of the air-bladder on each side, are in close relation with the organ of hearing. Indeed, a process of that organ projects into the front chamber on each side, and is separated by only a very delicate partition from the terminal sac of the air-bladder. Any vibrations of the air in these sacs, or any change in the pressure of the air in them, must thus tell upon the hearing apparatus.

There is no doubt about the existence of these structures which, together with the posterior opening of the air-bladder, were most accurately described, more than sixty years ago, by the eminent anatomist Weber, but I am afraid we are not much wiser regarding their meaning than we were when they were first made known. In fishes in general, there can be little doubt that the chief use of the air-bladder is to diminish the specific gravity of the fish and, by rendering its body of nearly the same weight as so much water, to render the business of swimming easier. In those fishes in which the passage of communication between the air-bladder and the alimentary canal is closed, the air is no doubt secreted into the air-bladder by its vessels, which are often very abundant. In the herring, the vessels of the air-bladder are very scanty; and it seems probable that the air is swallowed and forced into the air-bladder just as the loach swallows air and drives it into its intestine. And, as I have already suggested, it may be that the narrow posterior canal which leads from the air-bladder to the exterior is a sort of safety-valve allowing the air to escape, when the fish, rapidly ascending or descending, alters the pressure of the water upon the contained air.

This hypothesis may be put forward with some show of probability, but I really find it difficult to suggest anything with respect to the physiological meaning of the connection between the air-bladder and the ear. Nevertheless such an elaborate apparatus must have some physiological importance; and, this conclusion is strengthened by the well-known fact that there are a great many fishes in which the air-bladder and the ear become connected in one way or another. In the carp tribe, for example, the front end of the air-bladder is connected by a series of little bones with the organ of hearing, which is, as it were, prolonged backwards to meet these bones in the hinder end of the skull. But here, the air-bladder, which is very large, may act as a resonator; while, in the herring, the extreme narrowness of the passages which connect the air-bladder with the ear renders it difficult to suppose that the organ can have any such function.

In addition to the singular connection of the ear with the exterior by the roundabout way of the air-bladder, there are membranous spaces in the walls of the skull by which vibrations can more directly reach the herring's ear. And there is no doubt that the fish is very sensitive to such vibrations. In a dark night, when the water is phosphorescent or, as the fishermen say, there is plenty of "merefire," it is a curious spectacle to watch the effect of sharply tapping the side of the boat as it passes over a shoal. The herrings scatter in all directions, leaving streaks of light behind them, like shooting stars.

---

[1] See Müller, "Ueber Fische welche Tone von sich geben," *Archiv für Physiologie*, 1857, p. 267. The herring is not mentioned in Müller's list of vocal fishes.

The herring, like other fishes, breathes by means of the gills—the essential part of which consists of the delicate, highly-vascular filaments, which are set in a double row on the outer faces of each of the gill arches. The venous blood which returns from all parts of the body to be collected in the heart, is pumped thence into the gills, and there exchanges its excess of carbonic acid gas for the gaseous oxygen which is dissolved in sea-water. The freedom of passage of the water, and the great size and delicacy of the gills, facilitate respiration when the fish is in its native element; but the same peculiarities permitting of the rapid drying and coherence of the gills, and thus bringing on speedy suffocation, render its tenure of life, after removal from the water, as short as that of any fish. It may be observed, in passing, that the wide clefts behind the gill-covers of the herring have some practical importance, as the fish, thrusting its head through the meshes of the drift-net, is caught behind them and cannot extricate itself. In the herring, the upper end of the last gill cleft is not developed into a sac or pouch, such as we shall find in some of its near neighbours.

The only other organs of the herring, which need be mentioned at present, are the milt and roe, found in the male and female herring respectively.

These are elongated organs attached beneath the air-bladder, which lie, one on each side of the abdominal cavity, and open behind the vent by an aperture common to the two. The spermatic fluid of the male is developed in the milt and the eggs of the female in the roe. These eggs, when fully formed, measure from one-sixteenth to one-twenty-fifth of an inch in diameter; and, as, in the ripe female, the two roes or ovaries stretch from one end of the abdominal cavity to the other, occupying all the space left by the other organs, and distending the cavity, the number of eggs which they contain must be very great. Probably 10,000 is an under-estimate of the number of ripe eggs shed in spawning by a moderate-sized female herring. But I think it is safer than the 30,000 of some estimates, which appear to me to be made in forgetfulness of the very simple anatomical considerations that the roe consists of an extensive vascular framework as well as of eggs; and, moreover, that a vast number of the eggs which it contains remain immature, and are not shed at the time of spawning.

In this brief account of the structure of the herring I have touched only on those points which are peculiarly interesting, or which bear upon what I shall have to say by and by. An exhaustive study of the fish from this point of view alone would require a whole course of lectures to itself.

The herring is a member of a very large group of fishes spread over all parts of the world, and termed that of the *Clupeidæ*, after *Clupea*, the generic name of the herring itself. Our herring, the *Clupea harengus*, inhabits the White Sea and perhaps some parts of the Arctic Ocean, the temperate and colder parts of the Atlantic, the North Sea, and the Baltic, and there is a very similar, if not identical, species in the North Pacific. But it is not known to occur in the seas of southern Europe, nor in any part of the intertropical ocean, nor in the southern hemisphere.

There are four British fishes which so closely resemble herrings, externally and internally, that, though practical men may not be in any danger of confounding them, scientific zoologists have not always succeeded in defining their differences. These are the Sprat, the Allice and Twaite Shads, and the Pilchard.

The sprat comes nearest; indeed young herrings and sprats have often been confounded together, and doubts have been thrown on the specific distinctness of the two. Yet if a sprat and a young herring of the same size are placed side by side, even their external differences leave no doubt of their distinctness. The sprat's lower jaw is shorter; the shields in the middle of the belly have a sharper keel, whence the ventral edge is more like a saw; and the ventral fin lies vertically under the front edge of the dorsal fin, or even in front of it; while in the herring, though the position of the ventral fin varies a little, it lies more or less behind the front margin of the dorsal fin. The anal fin is of the same length as the dorsal, in the herring, longer than the dorsal in the sprat. But the best marks of distinction are the absence of vomerine teeth in the sprat, and the smaller number of pyloric cæca, which do not exceed nine, their openings being disposed in a single longitudinal series.

Shads and pilchards have a common character by which they are very easily distinguished from both sprat and herring. There is a horizontal fold of scaly skin on each side of the tail above and below the middle line. Moreover they have no teeth in the inside of the mouth, and their pyloric cæca are very numerous—a hundred or more—their openings being disposed five or six in a row.

The shads have a deep narrow notch in the middle line of the upper jaw, which is absent in the pilchard. The intestine of the shad is short and straight, like that of the herring; while that of the pilchard is long and folded several times upon itself.

Both of these fishes, again, possess a very curious structure, termed an accessory branchial organ, which is found more highly developed in other fishes of the herring family, and attains its greatest development in a fresh-water fish, the *Heterotis*, which inhabits the Nile. This organ is very rudimentary in the shad (in which it was discovered by Gegenbaur[1]), but it is much larger in the pilchard, in which, so far as I know, it has not heretofore been noticed. In *Chanos* and several other Clupeoid fishes it becomes coiled upon itself, and in *Heterotis* the coiled organ makes many turns. The organ is commonly supposed to be respiratory in function; but this is very doubtful.

Herrings which have attained maturity and are distended by the greatly enlarged milt or roe are ready to shed the contents of these organs or, as it is said to spawn. In 1862, we found a great diversity of opinion prevailed as to the time at which this operation takes place, and we took a great deal of trouble to settle the question, with the result which is thus stated in our Report:—

"We have obtained a very large body of valuable evidence on this subject, derived partly from the examination of fishermen and of others conversant with the herring fishery; partly from the inspection of the accurate records kept by the fishery officers at different stations, and partly from other sources; and our clear conclusion from all this evidence is, that the herring spawns at two seasons of the year, in the spring and in the autumn. We have hitherto met with no case of full or spawning herrings being found, in any locality, during what may be termed the solstitial months, namely June and December; and it would appear that such herrings are never (or very rarely) taken in May or the early part of July, in the latter part of November, or the early part of January. But a spring spawning certainly occurs in the latter part of January, in February, in March, and in April; and an autumn spawning in the latter part of July, in August, September, October, and even as late as November. Taking all parts of the British coast together, February and March are the great months for the spring spawning, and August and September for the autumn spawning. It is not at all likely that the same fish spawn twice in the year; on the contrary, the spring and the autumn shoals are probably perfectly distinct; and if the herring, according to the hypothesis advanced above, come to maturity in a year, the shoals of each spawning season would be the fry of the twelvemonth before. However, no direct evidence can be adduced in favour of this supposition, and it would be extremely difficult to obtain such evidence."[1]

---

[1] "Ueber das Kopfskelet von *Alepocephalus rostratus*," *Morphologisches Jahrbuch*, Bd. iv., Suppl 1878.

I believe that these conclusions, confirmatory of those of previous careful observers[2] are fully supported by all the evidence which has been collected, and the fact that this species of fish has two spawning seasons, one in the hottest and one in the coldest months of the year, is very curious.

Another singular circumstance connected with the spawning of the herring is the great variety of the conditions, apart from temperature, to which the fish adapts itself in performing this function. On our own coasts, herrings spawn in water of from ten to twenty fathoms, and even at greater depths, and in a sea of full oceanic saltness. Nevertheless herrings spawn just as freely, not only in the narrows of the Baltic, such as the Great Belt, in which the water is not half as salt as it is in the North Sea and in the Atlantic, but even in such long inlets as the Schlei in Schleswig, the water of which is quite drinkable and is inhabited by freshwater fish. Here the herrings deposit their eggs in two or three feet of water; and they are found, along with the eggs of freshwater fish, sticking in abundance to such freshwater plants as *Potamogeton*.

Nature seems thus to offer us a hint as to the way in which a fish like the shad, which is so closely allied to the herring, has acquired the habit of ascending rivers to deposit its eggs in purely fresh water.

If a full female herring is gently squeezed over a vessel of sea-water, the eggs will rapidly pour out and sink to the bottom, to which they immediately adhere with so much tenacity that, in half an hour, the vessel may be inverted without their dropping out. When spawning takes places naturally the eggs fall to the bottom and attach themselves in a similar fashion. But, at this time, the assembled fish dart wildly about, and the water becomes cloudy with the shed fluid of the milt. The eggs thus become fecundated as they fall, and the development of the young within the ova sticking to the bottom commences at once.

The first definite and conclusive evidence as to the manner in which herring spawn is attached and becomes developed that I know of, was obtained by Prof. Allman and Dr. MacBain in 1862,[3] in the Firth of Forth. By dredging in localities in which spent herring were observed on the 1st of March, Professor Allman brought up spawn in abundance at a depth of fourteen to twenty-one fathoms. It was deposited on the surface of the stones, shingle, and gravel, and on old shells and coarse shell-sand, and even on the shells of small living crabs and other crustacea, adhering tenaciously to whatever it had fallen on. No spawn was found in any other part of the Forth; but it continued to be abundant on both the east and the west sides of the Isle of May up to the 13th of March, at which time the incubation of the ovum was found to be completed in a great portion of the spawn, and the embryos had become free. On the 25th scarcely a trace of spawn could be detected, and nearly the whole of the adult fish had left the Forth.

Prof. Allman draws attention to the fact "that the deposit of spawn, as evidenced by the appearance of spent herrings, did not take place till about sixty-five days after the appearance of the herring in the Firth," and arrives at the conclusion that "the incubation probably continues during a period of between twenty-five to thirty days," adding however that the estimate must for the present be regarded as only approximative. It was on this and other evidence that we based our conclusion that the eggs of the herring "are hatched in at most from two to three weeks after deposition."

Within the last few years a clear light has been thrown upon this question by the labours of the West Baltic Fishery Commission, to which I have so often had occasion to refer.[1] It has been found that artificial-fecundation is easily practised, and that the young fish may be kept in aquaria for as long as five months. Thus, a great body of accurate information, some of it of a very unexpected character, has been obtained respecting the development of the eggs, and the early condition of the young herring.

It turns out that, as is the case with other fishes, the period of incubation is closely dependent upon warmth. When the water has a temperature of 53° Fahrenheit, the eggs of the herring hatch in from 6—8 days; the average being seven days. And this is a very interesting fact when we bear in mind the conclusion to which the inquiries of the Dutch meteorologists, and, more lately, those of the Scottish Meteorological Society appear to tend, namely, that the shoals prefer water of about 55°. At 50° Fahrenheit, the period of incubation is lengthened to eleven days; at 46° to fifteen days; and at 38° it lasts forty days. As the Forth is usually tolerably cool in the month of March, it is probable that Prof. Allman's estimate comes very near the truth for the particular case which he investigated.

The young, when they emerge from the egg, are from one-fifth to one-third of an inch in length, and so extremely unlike the adult herring that they may properly be termed larvæ. They have enormous eyes and an exceedingly slender body, with a yelk bag protruding from its forepart. The skeleton is in a very rudimentary condition; there are no ventral fins; and instead of separate dorsal, caudal, and anal fins, there is one continuous fin extending from the head along the back, round the tail, and then forwards to the yelk bag. The intestine is a simple tube, ciliated internally; there is no air-bladder, and no branchiæ are yet developed. The heart is a mere contractile vessel, and the blood is a clear fluid without corpuscles. At first the larvæ do not feed, but merely grow at the expense of the yelk, which gradually diminishes.

Within three or four days after hatching, the length has increased by about half the original dimensions, the yelk has disappeared, the cartilaginous skeleton appears, and the heart becomes divided into its chambers; but the young fish attains nearly double its first length before blood corpuscles are visible.

By the time the larva is two-thirds of an inch long (a length which it attains one month after hatching), the primitive median fin is separated into dorsal, caudal, and anal divisions, but the ventral fins have not appeared. About this period the young animal begins to feed on small crustacea; and it grows so rapidly that, at two months, it is 1¼ inch long, and, at three months, has attained a length of about two inches.

Nearly up to this stage the elongated scaleless little fish retains its larval proportions; but, in the latter part of the third month, the body rapidly deepens, the scales begin to appear, and the larva passes into the "imago" state —that is, assumes the form and proportions of the adult, though it is not more than two inches long. After this, it goes on growing at the same rate (11 millimetres, or nearly half an inch) per month, so that, at six months old, it is as large as a moderate-sized sprat.

The well-known "whitebait" of the Thames consists, so far as I have seen, almost exclusively of herrings, under six months old, and as the average size of whitebait increases, from March and April onwards, until they become suspiciously like sprats in the late summer, it may be concluded that they are the progeny of herrings which spawned, early in the year, in the neighbourhood of the estuary of the Thames, up which these dainty little fish have wandered. Whether it is the general habit of young herring, even of those which are spawned in deep water, to migrate into the shallow parts of the sea, or even into completely fresh waters, when such are accessible, is unknown.

[1] "Report of the Royal Commission on the operation of the Acts relating to Trawling for Herrings on the Coast of Scotland (1863)," p. 28

[2] Brandt and Ratzeburg, for example, in 1833 strongly asserted that the herring has two spawning seasons

[3] "Report of the Royal Commission on the Operation of the Acts relating to Trawling for Herring on the Coast of Scotland, 1863."

[1] See the four valuable memoirs, Kupffer, "Ueber Laichen und Entwickelung des Herings in der westlichen Ostsee", *Idem*, "Die Entwickelung des Herings im Ei"; Meyer, "Beobachtungen uber den Wachsthum des Herings"; Heincke, "Die Varietäten des Herings," which are contained in the *Jahresbericht der Commission in Kiel für* 1874-75-76 — 1878 Widegren's essay "On the Herring," 1871, translated from the Danish in U.S. Commission Reports, 1873—75, also contains important information.

In the Report on Trawling (1863) we observe :—

"It is extremely difficult to obtain any satisfactory evidence as to the length of time which the herring requires to pass from the embryonic to the adult or *full* condition. Cf the fishermen who gave any opinion on this subject, some considered that a herring takes three, and others that it requires seven, years to attain the full or spawning condition; others frankly admitted that they knew nothing about the matter; and it was not difficult, by a little cross-examination, to satisfy ourselves that they were all really in this condition, however strongly they might hold by their triennial or septennial theories. Mr. Yarrell and Mr. Mitchell suppose with more reason that herring attain to full size and maturity in about eighteen months.

"It does not appear, however, that there is any good evidence against the supposition that the herring reaches its spawning condition in one year. There is much reason to believe that the eggs are hatched in, at most, from two to three weeks after deposition, and that in six to seven weeks more (that is at most ten weeks from the time of laying the eggs) the young have attained three inches in length. Now it has been ascertained that a young smolt may leave a river and return to it again in a couple of months increased in bulk eight or tenfold, and as a herring lives on very much the same food as a smolt, it appears possible that it should increase in the same rapid ratio. Under these circumstances nine months would be ample time for it to enlarge from three to ten or eleven inches in length. It may be fairly argued, however, that it is not very safe to reason analogically from the rate of growth of one species of fish to that of another; and it may be well to leave the question whether the herring attains its maturity in twelve, fifteen, or sixteen months open, in the tolerably firm assurance that the period last named is the maximum."

On comparing these conclusions with the results of the careful observations of the Baltic Commissioners, it appears that we somewhat over-estimated the rate of growth of the young herring, and that the view taken by Yarrell and Mitchell is more nearly correct. For supposing that the rate of growth after six months continues the same as before, a herring twelve months old will be nearly six inches long, and at eighteen months eight or nine inches. But full herrings may be met with little more than seven inches long, and they are very commonly found not more than nine inches in length.[1]

Fishermen distinguish four states of the herring. Fry or sile, when not larger than sprats; maties, when larger than this, with undeveloped roe or milt; full fish, with largely developed roe or milt; and spent or shotten fish, which have recently spawned.

Herring fry of the size of sprats are distinguished from full fish not merely by their size, but in addition, by the very slight development of the milt or roe, and by the accumulation of fat in the abdominal cavity. Bands of fat are found in the mesentery alongside the intestine, and filling up the interspaces between the pyloric cæca. Maties (the name[1] of which is a corruption of the Dutch word for a maiden) resemble the fry in these particulars; but, if they are well fed, the deposit of fatty and other nutritive matter takes place, not only about the abdominal viscera, but also beneath the skin and in the interstices of the flesh. Indeed, when nourishment is abundant, this infiltration of the flesh with fat may go so far that the fish cannot readily be preserved and must be eaten fresh. The singularly delicate Loch Fyne herrings are in this condition early in the season. When the small crustaceans, on which the maties chiefly feed, are extremely abundant the fish gorge themselves with them to such an extent that the conical crop becomes completely distended, and the Scotch fishermen give them the name of "gut-pock herrings," as much as to say pouch-gutted fish, and an absurd notion is current that these herrings are diseased. However, the "gut-pock" herrings differ from the rest only in having their pouch full instead of empty, as it commonly is.

As the fish passes from the matie to the full condition, the milt and roe begin to grow at the expense of the nutriment thus stored up; and, as these organs become larger and occupy more and more space in the abdominal cavity, the excess of nutritious substance is transferred to them. The fatty deposit about the intestine and pyloric cæca gradually disappears and the flesh becomes poorer. It would appear that by degrees the fish cease to feed at all. At any rate, there is usually no food in the stomach of a herring which approaches maturity. In all these respects there is the closest resemblance between the history of the herring and that of other fishes such as the salmon—the parr correspnding to the herring fry or sile, the grilse and the "clean fish" of larger size to the maties.

At length spawning takes place, the accumulated nutrition, transformed into eggs or spermatic fluid, is expelled, and the fish is left in that lean and depauperated state which makes a "shotten herring" proverbial. In this condition it answers to the salmon "kelt," and the milt or roe are now shrunk and flaccid and can be blown up with air like empty bags. If the spent fish escapes its myriad enemies, it doubtless begins to feed again and once more passes into the matie state in preparation for the next breeding season. But the nature of this process of recuperation has yet to be investigated.

When they have reached the matie stage, the herrings, which are at all times gregarious, associate together in conspicuous assemblages, which are called shoals. These are sometimes of prodigious extent—indeed eight or nine miles in length, two or three in breadth, with an unknown depth, are dimensions which are credibly asserted to be sometimes attained. In these shoals the fish are closely packed, like a flock of sheep straying slowly along a pasture, and it is probably quite safe to assume that there is at least one fish for every cubic foot of water occupied by the shoal. If this be so, every square mile of such a shoal, supposing it to be three fathoms deep, must contain more than 500,000,000 herrings. And when it is considered that many shoals approach the coasts, not only of our own islands, but of Scandinavia and the Baltic, and of Eastern North America, every spring and autumn, the sum total of the herrings which people our seas surpasses imagination.

If you read any old and some new books on the natural history of the herring, you will find a wonderful story about the movements of these shoals. How they start from their home in the Polar Seas, and march south as a great armada which splits into minor divisions—one destined to spawn on the Scandinavian, and one on our own shores; and how, having achieved this spawning raid, the spent fish make their way as fast as they can back to their Arctic refuge, there to repair their exhausted frames in domestic security. This story was started in the last century, and was unfortunately adopted and disseminated by our countryman Pennant. But there is not the least proof that anything of the kind takes place, and the probabilities are wholly against it. It is, for example, quite irreconcilable with the fact that herring are found in cods' stomachs all the year round. And the circumstance to which I have already adverted, that practised eyes distinguish local breeds of herrings, though it does not actually negative the migration hypothesis, is very much against it. The supposition that the herring spawn in the north in the early spring, and in the south in the autumn, fitted very well into the notion that the vanguard of the migrating body of herrings occupied the first spawning ground it reached, and obliged the rest of the horde to pass on. But, as a matter of fact, the northern herrings, like the southern, have two spawning times; or perhaps it would be more correct to say that the spawning time extends from autumn to spring, and has two maxima—one in August-September, and one in February-March.

---

[1] Ljungman ("Preliminary Report on Herrings and Herring Fisheries on the West Coast of Sweden," translated in U.S. Commission Report, 1873-5) speaks of full herrings ready to spawn only 100-110 mm. (4 to 4½ in.) long, as observed by himself.

[1] "Halecum intestina, non modo multa gaudere obesitate, sed et totum corpus eo adeo esse impletum ut aliquando, cum discinditur, pinguedo ex cultro defluat, et praesertim eo quidem tempore ubi halecum lactes aut ova crescere primum incipiunt, unde nostrates eos *Maatjens-Haringen* dicere solent."—A. v. Leeuwenhoek, "Arcana Naturæ," Ep. xcvii. (1696).

Leeuwenhoek also mentions having heard of "gut pock" herrings from Scotch fishermen.

Finally, there is no evidence that herrings are to be met with in the extreme north of their range, at other times, or in greater abundance, than they are to be found elsewhere.

In the matter of its migration, as in other respects, the herring compares best with the salmon. The ordinary habitation of both fishes is no doubt the moderately deep portion of the sea. It is only as the breeding time draws near that the herrings (not yet advanced beyond the matie state) gather together towards the surface and approach the land in great shoals for the purpose of spawning in relatively or absolutely shallow water. In the case of the herring of the Schlei we have almost the connecting link between the exclusively marine ordinary herring and the river ascending salmon.

The records of the herring fisheries are, for the most part, neither very ancient nor (with the exception of those of the Scotch Fishery Board) very accurately kept; and, from the nature of the case, they can only tell us whether the fish in any given year were readily taken or not, and that may have very little to do with the actual strength of the shoals.

However, there is historical evidence that, long before the time of Henry the First, Yarmouth was frequented by herring fishers. This means that, for eight centuries, herrings have been fished on the English coast, and I cannot make out, taking one year with another, in recent times, that there has been any serious fluctuation in their numbers. The number captured must have enormously increased in the last two centuries, and yet there is no sign of diminution of the shoals.

In 1864, we had to listen to dolorous prophecies of the coming exhaustion of the Scotch herring fisheries. The fact that the returns showed no falling off was ascribed to the improvement of the gear and methods of fishing, and to the much greater distances to which the fishermen extend their operations. Yet what has really happened? The returns of subsequent years prove, not only that the average cure of the decade 1869-78 was considerably greater than that of the previous decade, but that the years 1874 and 1880 are absolutely without parallel in the annals of the Scotch herring fishery, a million barrels having been cured in the first of these years, and a million and a half in 1880. In the decade 1859-68, the average was 670,000 barrels, and the highest 830,000.

In dealing with questions of biology, *à priori* reasoning is somewhat risky, and if any one tells me "it stands to reason" that such and such things must happen, I generally find reason to doubt the safety of his standing.

It is said that "it stands to reason" that destruction on such a prodigious scale as that effected by herring fishers must tell on the supply. But again let us look at the facts. It is said that 2,500,000,000, or thereabouts, of herrings are every year taken out of the North Sea and the Atlantic. Suppose we assume the number to be 3,000,000,000 so as to be quite safe. It is a large number undoubtedly, but what does it come to? Not more than that of the herrings which may be contained in one shoal, if it covers half a dozen square miles—and shoals of much larger size are on record. It is safe to say that, scattered through the North Sea and the Atlantic, at one and the same time, there must be scores of shoals, any one of which would go a long way towards supplying the whole of man's consumption of herrings. I do not believe that all the herring fleets taken together destroy 5 per cent. of the total number of herrings in the sea in any year, and I see no reason to swerve from the conviction my colleagues and I expressed in our Report, that their destructive operations are totally insignificant when compared with those which, as a simple calculation shows, must regularly and normally go on.

Suppose that every mature female herring lays 10,000 eggs, that the fish are not interfered with by man, and that their numbers remain approximately the same year after year, it follows that 9998 of the progeny of every female must be destroyed before they reach maturity. For if more than two out of the 10,000 escape destruction, the number of herrings will be proportionately increased. Or in other words, if the average strength of the shoals which visit a given locality is to remain the same year by year, many thousand times the number contained in those shoals must be annually destroyed. And how this enormous amount of destruction is effected will be obvious to any one who considers the operations of the fin-whales, the porpoises, the gannets, the gulls, the codfish, and the dogfish, which accompany the shoals and perennially feast upon them; to say nothing of the flat-fish, which prey upon the newly-deposited spawn; or of the mackerel, and the innumerable smaller enemies which devour the fry in all stages of their development. It is no uncommon thing to find five or six—nay, even ten or twelve—herrings in the stomach of a codfish,[1] and, in 1863, we calculated that the whole take of the great Scotch herring fisheries is less than the number of herrings which would in all probability have been consumed by the codfish captured in the same waters if they had been left in the sea.[2]

Man, in fact, is but one of a vast co-operative society of herring-catchers, and the larger the share he takes, the less there is for the rest of the company. If man took none, the other shareholders would have a larger dividend, and would thrive and multiply in proportion, but it would come to pretty much the same thing to the herrings.

As long as the records of history give us information, herrings appear to have abounded on the east coast of the British Islands, and there is nothing to show, so far as I am aware, that, taking an average of years, they were ever either more or less numerous than they are at present. But in remarkable contrast with this constancy, the shoals of herrings have elsewhere exhibited a change capriciousness—visiting a given locality for many years in great numbers, and then suddenly disappearing. Several well-marked examples of this fickleness are recorded on the west coast of Scotland; but the most remarkable is that furnished by the fisheries of Bohuslan, a province which lies on the south-western shore of the Scandinavian peninsula. Here a variety known as the "old" or

---

[1] In his valuable Report on the Salt Water Fisheries of Norway (1877), Prof. Sars expresses the belief that full-grown codfishes feed chiefly, if not exclusively, on herrings.

[2] In 1879 rather more than 5,000,000 cod, ling, and hake, were taken by the Scottish fishermen. Allowing each only two herrings a day, these fishes would have consumed more than three thousand five hundred million of herrings in a year. As to the Norwegian fisheries, 20,000,000 codfishes are said to be taken annually by the Lofoden fishermen alone.

"great" herring, after being so extremely abundant, for about sixty years, as to give rise to a great industry, disappeared in the year 1808, as suddenly as they made their appearance, and have not since been seen in any number.

The desertion of their ordinary grounds by the herring has been attributed to all imaginable causes, from fishing on a Sunday to the offence caused to the fish by the decomposing carcases of their brethren, dropped upon the bottom out of the nets. The truth is that absolutely nothing is known on the subject; and that little is likely to be known, until careful and long-continued meteorological and zoological observations have furnished definite information respecting the changes which take place in the temperature of the sea, and the distribution of the pelagic crustacea which constitute the chief food of the herring shoals. The institution of systematic observations of this kind is an object of international importance, towards the attainment of which the British, Scandinavian, Dutch, and French Governments might wisely make a combined effort.

A great fuss has been made about trawlers working over the spawning grounds of the herring. "It stands to reason," we were told, that they must destroy an immense quantity of the spawn. Indeed this looked so reasonable, that we inquired very particularly into a case of the alleged malpractice which was complained of on the east coast of Scotland, near Pittenweem. Off this place, there is a famous spawning ground known as the Traith hole, and we were told that the trawlers worked vigorously over the spot immediately after the herring had deposited their spawn. Of course our first proceeding was to ask the trawlers why they took the trouble of doing what looked like wanton mischief. And their answer was reasonable enough. It was to catch the prodigious abundance of flat-fish which were to be found on the Traith at that time. Well, then, why did the flat-fish congregate there? Simply to feed on herring eggs, which seem to be a sort of flat-fishes' caviare. The stomachs of the flat-fish brought up by the trawl were, in fact, crammed with masses of herring eggs.

Thus every flat-fish caught by the trawl was an energetic destroyer of herring arrested in his career. And the trawling, instead of injuring the herring, captured and removed hosts of their worst enemies. That is how "it stood to reason" when one got to the bottom of the matter.

I do not think that any one who looks carefully into the subject will arrive at any other conclusion than that reached by my colleagues and myself: namely, that the best thing for Governments to do in relation to the herring fisheries, is to let them alone, except in so far as the police of the sea is concerned. With this proviso, let people fish how they like, as they like, and when they like. At present, I must repeat the conviction we expressed so many years ago, that there is not a particle of evidence that anything man does has an appreciable influence on the stock of herrings. It will be time to meddle, when any satisfactory evidence that mischief is being done is produced

---

NOTES

THE fifty-first Annual Meeting of the British Association for the Advancement of Science will commence at York on Wednesday, August 31, 1881. The President-Elect is Sir John Lubbock, Bart, M.P., F.R.S. Vice-Presidents Elect: His Grace the Archbishop of York, D.D., F.R.S.; the Right Hon. the Lord Mayor of York; the Right Hon. Lord Houghton, F.R.S.; the Ven. Archdeacon Creyke, M.A.; the Hon. Sir W. R. Grove, F.R.S.; Prof. G. G. Stokes, Sec. R.S.; Sir John Hawkshaw, C.E., F.R.S.; Allen Thomson, M.D., F.R.S. L. and E.; Prof. Allman, M.D., F.R.S. L. and E. General Secretaries: Capt. Douglas Galton, C.B., D.C.L., F.R.S.; Philip Lutley Sclater, Ph.D., F.R.S. Acting Secretary: George Griffith, M.A., F.C.S., Harrow; General Treasurer: Prof. A. W. Williamson, F.R.S., University College, London, W.C. Local Secretaries: Rev. Thomas Adams, M.A.; Tempest Anderson, M.D., B.Sc., York. Local Treasurer: W. W. Wilberforce, York. The Sections are the following:—A.—Mathematical and Physical Science.—President: Prof. Sir William Thomson, F.R.S. L. and E. Vice-Presidents.—Prof. J. C. Adams, F.R.S.; T. Archer Hirst, Ph.D., V.P.R.S. Secretaries: Prof. W. E. Ayrton; Oliver J. Lodge, D.Sc.; Donald McAlister, B.A., B.Sc. (Recorder). B.—Chemical Science.—President: Prof. A. W. Williamson, For. Sec. R.S., V.P.C.S. Vice-Presidents: F. A. Abel, C.B., F.R.S.; Prof. Odling, F.R.S. Secretaries: Harold B. Dixon, M.A.; P. Phillips-Bedson, D.Sc. (Recorder). C.—Geology.—President: Andrew Crombie Ramsay, LL.D., F.R.S., Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology. Vice-Presidents: Prof. Prestwich, F.R.S.; Prof. W. C. Williamson, F.R.S.; Secretaries: W. Topley, F.G.S. (Recorder); W. Whitaker, F.G.S. D.—Biology.—President: Richard Owen, C.E, F.R.S. Vice-Presidents: Prof W. H. Flower, F.R.S.; Prof. J. S. Burdon Sanderson, F.R.S. Secretaries: G. W. Bloxam, M.A., F.L.S.; W. L. Distant; W. A. Forbes, F.Z.S.; Prof M'Nab, M.D.; John Priestley; Howard Saunders, F.L.S., F.Z.S. Department of Zoology and Botany.—Richard Owen, C.E., F.R.S. (President), will preside. Secretaries: Prof. M'Nab, M.D. (Recorder); Howard Saunders, F.L.S., F.Z.S. Department of Anthropology.—Prof. W. H. Flower, F.R.S. (Vice-President), will preside. Secretaries: G. W. Bloxam, M.A., F.L.S. (Recorder); W. L. Distant. Department of Anatomy and Physiology.—Prof. J. S. Burdon Sanderson, F.R.S. (Vice-President), will preside. Secretaries: John Priestley (Recorder); W. A. Forbes, F.Z.S. E.—Geography.—President: Sir J. D. Hooker, K.C.S.I., C.B., F.R.S. Vice-Presidents: Francis Galton, F.R.S.; Prof. Sir C. Wyville Thomson, F.R.S. L. & E. Secretaries: H. W. Bates, Assist.-Sec. R.G.S., F.L.S.; E. C. Rye, Librarian R.G.S., F.Z.S. (Recorder). F.—Economic Science and Statistics.—President: The Right Hon. M. E. Grant Duff, M.P., F.R.S. Vice-Presidents: Sir George Campbell, K.C.S.I., M.P.; James Heywood, F.R.S. Secretaries: Constantine Molloy (Recorder); J. F. Moss. G.—Mechanical Science.—President: Sir W. G. Armstrong, C.B., F.R.S. Vice Presidents: W. H. Barlow, F.R.S., Pres. Inst. C.E.; C. W. Siemens, D.C.L., F.R.S. Secretaries: A. T. Atchison, M.A. (Recorder); H. Trueman Wood, B.A. Tickets for the meeting may be obtained of the Local Secretaries at York, and at the Office of the Association, 22, Albemarle Street, London, W.; or on application by letter, from August 17 to August 24, to the General Treasurer, Prof. A. W. Williamson, British Association, University College, London, W.C. The First General Meeting will be held on Wednesday, August 31, at 8 p.m. precisely, when A. C. Ramsay, F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom, and of the Museum of Practical Geology will resign the chair, and Sir John Lubbock, Bart., M.P., F.R.S., President-Elect, will assume the presidency, and deliver an address. On Thursday evening, September 1, at 8 p.m., a *soirée*; on Friday evening, September 2, at 8.30 p.m., a discourse by T. H. Huxley, LL.D., Sec. R.S., Professor of Natural History in the Royal School of Mines; on Monday evening, September 5, at 8.30 p.m., a discourse by W. Spottiswoode, D.C.L., LL.D., President of the Royal Society; on Tuesday evening, September 6, at 8 p.m., a *soirée*; on Wednesday, September 7, the concluding general meeting will be held at 2.30 p.m. No report, paper, or abstract, can be inserted in the Report of the Association unless it is given in before the conclusion of the meeting. Excursions to places of interest in the neighbourhood of York will be made on the afternoon of Saturday, September 3, and on Thursday, September 8.

THE honorary degree of LL.D. has been conferred on the following gentlemen by the University of Glasgow:—F. M. Balfour, M.A., Fellow of Trinity College, Cambridge; Dr. Angus Smith, F.R.S., Government Inspector of Alkali Works; Prof. Richard Owen, C.B., F.R.S., Superintendent of Natural History Collections of the British Museum; Andrew Buchanan, M.D., Emeritus Professor of Physiology in the University of Glasgow.

THE honorary degree of LL.D. has been conferred by the University of Edinburgh on Prof. A. W. Williamson, of University College, London.

IT is intended to celebrate in Edinburgh the centenary of the birthday of Sir David Brewster, on December 9, by a public dinner.

THE annual meeting of the Iron and Steel Institute will be held in London on May 4, 5, and 6. On May 4 the Bessemer Medal for 1881 will be presented to Mr. William Menelaus, and the president-elect (Mr. Josiah T. Smith) will deliver his inaugural address. The following is the list of papers to be read:—On the Results of Experiments relative to Corrosion in Iron and Steel, by Mr. William Parker of Lloyd's Registry, London; On the Manufacture of Armour Plates, by Mr. Alexander Wilson, Sheffield; On the Manufacture of Steel and Steel Plates in Russia, by Mr. Sergius Kern, St. Petersburg; On the Use of Steel for Shipbuilding, by Mr. William Denny, Dumbarton; On some Physical Properties of Cast Iron, by Mr. Charles Markham, Staveley; On the Desulphurisation of Iron, by M. Rollet, St. Chamond, France; On Iron and Steel Permanent Way, by Mr. R. Price Williams, London; On Hydraulic Appliances for the Bessemer Process, by Mr. Michael Scott, London; On the Manufacture of Bessemer Steel and Steel Rails in America, by Capt. Jones, Edgar Thomson Steel Works, Pittsburg, U.S.A.; On Hydrogen and Carbonic Oxide in Iron and Steel, by Mr. John Parry, Ebbw Vale; On the Preservation of Iron and Steel Surfaces, by Mr. George Bower, St. Neots; On a new method for the determination of Oxygen in Iron and Steel, by Mr. Alex. E. Tucker, Rhymney.

DURING the Summer Term of the City and Guilds of London Institute, commencing May 2, 1881, Prof. Armstrong, Ph.D., F.R.S., and Prof. Ayrton, A.M., Inst.C.E., will continue their tutorial and laboratory courses of instruction in chemistry and physics as applied to the arts and manufactures, at the Cowper Street Schools, pending the present erection of the City and Guilds of London Technical College, Finsbury, the foundation stone of which will be laid by Prince Leopold on May 10. There are both day and evening classes at the institute, with means for ample laboratory practice, at fees which place the education within reach of all classes. We would specially draw attention to the fact that these classes and the laboratory practice are open, at an almost nominal fee, to female as well as to male students. For every hour of lecture there are two hours laboratory work included in this nominal fee. The day classes would be of service to girls who have not the means to obtain a Girton or a Newnham education, while the evening classes will be of great use to those women who take more than a mechanical interest in their daily work; for from the course of instruction and their own work in the laboratory they will gain such a thorough knowledge of principles as should distinguish a skilled workwoman from a mere machine.

THE Annual Report for the past year of the Jamaica Public Gardens, by Mr. D. Morris, the new director, is one of great interest. As the year has been the first under the new organisation, the chief work has naturally been of a departmental character, but from the details given, it is evident that important advances have been made in developing several industries which must have an important influence for good on the future of the island. From the variation in altitude of the different gardens under Mr. Morris's charge excellent opportunities are afforded for experimenting on various kinds of cultivation, and these he is evidently prepared to take full advantage of. Among the various cultures, concerning which interesting information is contained in the Report, are Cinchona, Liberian Coffee, Sugar Canes, Teak and Mahogany, Pine-Apples, Jalap, Cacao, Tobacco, India-Rubber, various spices, Oranges, Banana Fibre, &c. The best results may be looked for from Mr. Morris's vigorous and intelligent directorship.

WE have also a very satisfactory Report of work for the year ending March 31, 1880, from Mr. Duthie, superintendent of the Government Botanical Gardens at Saharanpor and Mussooree. As in Jamaica, experiments, some of them very successful, have been carried on in the rearing of various useful plants, including vegetable and medicinal plants. Much difficulty has been experienced by Mr. Duthie in training *Mallies* for work in the gardens, and he has some trials before him ere he is able to turn out a staff of properly-trained natives.

MR. M. G. MULHALL sends us the following curious note, which we give without comment:—"Although Shakespeare is supposed to have taken the idea of Hamlet from the Danish historian Saxo-Grammaticus, there are such points of resemblance with the Arabic chronicle of Nigiaristan, respecting Montasser, tenth Caliph of Bagdad, that I venture to call your attention to the same. The points of analogy are as follows: 1. That Montasser is murdered by putting poison in his ear. 2. The ghost scene, in which his father appears to him. 3. The displaying of tapestry before the Caliph and his court, in which the tapestry represents a tragedy identical with the late Caliph's murder."

THE *Daily News* New York correspondent telegraphs that the aldermen have passed, over the mayor's veto, the ordinance giving the Edison Electric Lighting Company permission to lay tubes in the streets. "The company will proceed immediately to introduce its new electric lamps in the offices in the business portion of the city around Wall Street. The construction of the lamp is simple. It consists of a small bulbous glass globe, four inches long, an inch and a half in diameter, with a carbon loop which becomes incandescent when the electric current passes through. Each lamp is of sixteen candle-power, with no perceptible variation in intensity. The light is turned on or off with a thumbscrew. Wires have already been put into forty buildings. The company will compete with the gas companies by charging the same rates. If the latter reduce, the Edison Company will also reduce, and are prepared to go lower than the gas companies can."

AT five o'clock on Saturday morning a strong shock of earthquake was felt at Paola in the province of Calabria. On the night of April 19 there was another severe shock of earthquake at Chios.

A NEW illustrated work on the Butterflies of Europe is, we understand, in active preparation by Dr. Lang, F.L.S. Its publication, in monthly parts, will be commenced very shortly by Messrs. Lovell, Reeve, and Co.

MRS. BURTON, the wife of the well-known Capt. R. Burton, our Consul at Trieste, is evidently doing a good work in that city in teaching the people kindness to animals. The lesson is evidently much needed, and judging from Mrs. Burton's speech at her last fête and distribution of prizes, her efforts are meeting with decided success. Of course all this costs money; possibly some of our readers may be inclined to help by sending a contribution to Mrs. Richard Burton, British Consulate, Trieste, Austria.

OWING to the outcry caused by the sale to a private person of the Katoomba Falls, in the Blue Mountains, the New South Wales Government, according to the *Colonies and India*, has set apart for public use large tracts of land round Dangar's Falls, near Armidale, the Great Falls in the same district, and Moona Falls, near Walcha, in imitation of the reserves or national parks in the United States of America.

A REMARKABLE frost is said to have occurred in Guatemala on February 10, doing great damage to the tropical vegetation.

IN the review of Messrs. Fison and Howitt's "Kamilaroi and Kurnai" that appeared last week, we should have mentioned that the book is published in England by Messrs. Macmillan and Co.

FROM Glasgow we have received two satisfactory Reports—that of the Industrial Museum, presided over by Mr. James Paton, and that of the Mitchell Library, under Mr. F. T. Barrett.

TWO HUNDRED AND TEN school teachers nominated on purpose by the 30,000 public teachers of elementary schools in France, and travelling at the expense of the Government, were summoned to Paris in order to hold a Pedagogic Congress, which came to a close on the 24th. At the same time the Ligue de l'Enseignement, founded by M. Jean Macé, held a series of meetings at the Trocadéro. The concluding sitting, which took place last Thursday, was attended by all the school teachers and an immense number of political leaders. M. Gambetta delivered a speech praising the advantages of education, commending school teachers as a body, and advocating the importance of interesting ladies in the general diffusion of knowledge.

MESSRS. MARSHALL JAPP, AND CO., have published a useful little Half-Holiday Handbook of Geological Rambles around London, which will be found to add much interest to a Saturday afternoon walk into the country.

MR. H. L. JANSSEN VAN RAAY writes to us from Batavia, March 21, that in the enumeration of the different geographical societies of the world in NATURE, vol. xxiii. p. 299, the Geographical Society at Samarang (Java), founded in 1879, was omitted.

FIDELIS BUTSCH' SOHN of Augsburg has issued a priced catalogue of the extensive library of the late Prof. W. P. Schimper of Strassburg.

THE new number of the *Proceedings* of the Bristol Natural History Society contains some good papers:—Some Optical Illusions, by Prof. S. P. Thompson; Underground Temperature, by Mr. E. Wethered; The Structure and Life-History of a Sponge, by Mr. W. G. Sollas; On some Cases of Prolification in *Cyclamen Persicum*, by Mr. A. Leipner; The Ethnology of the Paropamisus, by Dr. J. Beddoe, F.R.S.; Catalogue of the Lepidoptera of the Bristol District, by Mr. A. E. Hudd, and of the Fungi, by Mr. C. Bucknall; The Pomarine Skua, by M. H. Charbonnier.

THE additions to the Zoological Society's Gardens during the past week include three Short-tailed Wallabys (*Halmaturus brachyurus*) from West Australia, presented by Sir Harry St. George Ord, C.B., H.M.Z.S.; three Green Lizards (*Lacerta viridis*) from Jersey, presented by Mr. E. H. Bland; a Rufous Rat Kangaroo (*Hypsiprymnus rufescens*) from Australia, presented by Mr. A. W. Wyatt; a Lion (*Felis leo* ♀) from Africa, deposited; three Entellus Monkeys (*Semnopithecus entellus* ♂ ♂ ♀) from India, purchased; a Lion (*Felis leo* ♀) from Africa; a Common Otter (*Lutra vulgaris* ♀), British, received in exchange; a Collared Fruit Bat (*Cynonycteris collaris*), a Vulpine Phalanger (*Phalangista vulpina*), born in the Gardens.

CHEMICAL NOTES

IN *Journal pract. Chemie*, Herr Cech, in the course of a paper on the decompositions which occur during the rotting of eggs, describes experiments which he thinks establish the possibility of obtaining a good soap free from smell, by saponifying with soda the residue obtained by evaporating to dryness rotten eggs, freed from their shells. Such a dried residue yields about 10·5 per cent. of oil, fresh eggs giving about 11 per cent.

THE changes undergone by grain when stored in underground magazines have been recently studied by M. Muntz (*Compt. rend.*). The magazines of the Paris Omnibus Company are partly underground; the grain in the upper parts is, however, exposed to the influence of atmospheric changes; it is found to contain much more moisture and to be at a higher temperature than that in the lower parts. The relative amounts of deterioration in grains may be measured by the quantities of carbonic anhydride exhaled. When grain is freely exposed to air about ten times as much carbonic anhydride is given off as when the grain is kept in closed receptacles; less oxygen is absorbed than corresponds with this evolution of carbon dioxide. Normal grain contains from 11 to 19 per cent. of moisture: the greater the moisture the greater the exhalation of carbon dioxide. The amount of the gas evolved also increases with increase of temperature until a point is reached at which true chemical combustion of the carbon begins, as distinguished from the physiological combustion which has preceded it. Grain which is to be kept for any time ought to be very dry, the receptacle containing it ought to be completely closed, and all parts of this receptacle ought to be at approximately the same temperature.

MR. V. LEWES, in the same journal, describes barium pentathionate, $BaS_5O_6 \cdot 3H_2O$, and several potassium pentathionates, prepared by slow evaporation in a vacuum of "Wackenroder's solution." These experiments appear to establish beyond doubt the existence of pentathionic acid.

DRS. DUPRÉ AND HAKE have applied their method for the estimation of carbon (*Chem. Soc. Journ.*)—viz. burning in oxygen, absorbing carbonic anhydride in baryta water, converting the barium carbonate into sulphate, and weighing as such—to the estimation of carbon in air; their experiments apparently demonstrate the presence in London air of carbon in forms other than carbonic anhydride, and probably in the form of some volatile organic compounds, not as suspended matter. Drs. Dupré and Hake claim that their method of analysis enables them to estimate carbonic anhydride, carbon in the peculiar forms already noticed, and suspended carbonaceous matter in air.

IN the same journal there is a contribution to the history of ozone by Prof. Hartley of Dublin. The main conclusions drawn from experimental data are these: Ozone is a normal constituent of the higher atmosphere, and is present therein in larger proportion than near the surface of the earth. The limitation of the solar spectrum in the ultra-violet is readily accounted for by the absorptive action of atmospheric ozone, without taking into account the possible absorptive power of nitrogen and oxygen. The blue tint of the atmosphere is probably due to ozone. It is shown in the paper that the wave-length of the extreme ray capable of absorption by considerable quantities of ozone is about 316. A quantity of 2·5 mgm. of ozone in each square centimetre of sectional area of a column of air produces, it is said, a full sky-blue tint. Incidentally experiments are described in which one volume of ozone was distinctly detected by the sense of smell in 2,500,000 volumes of air.

MR. G. S. JOHNSON has obtained ammonia (*Chem. Soc. Journal*) by passing hydrogen and (presumably) pure nitrogen over cold or moderately heated spongy platinum: when however the mixed gases were passed over hot asbestos before traversing the spongy platinum, *no* ammonia was formed. Mr. Johnson thinks that nitrogen probably exists in two forms, an active and an inactive form, the latter being produced by the action of heat on the former.

DR. DUPRÉ has introduced (*Analyst*) a slight modification into the ordinary method for observing a colour change in titrating with standard solutions, which is said to render the perception of the change very sharp and accurate. He views the liquid to be titrated through a glass cell containing a solution of the same colour as, and about equal in intensity to, the liquid itself.

M. LONGUININE has recently determined (in *Compt. rend.*) the heats of combustion of various alcohols of the allyl series, and compared the numbers with those expressing the heats of combustion of metameric aldehydes. He finds very marked differences between the two series of numbers, showing once more a distinct connection between the energy lost by a carbon compound in passing from one state to another standard state, and the structure of the molecule of that compound.

M. BERTHELOT, in continuation of his researches on compounds of metallic halogen salts with haloid acids, describes in *Compt. rend.* the action of gaseous hydrochloric and hydrobromic acids on alkali chlorides and bromides; he shows that the gaseous acids are absorbed by the dry salts with disengagement of heat, and that the products of the actions are possessed of properties which distinguish them from mere mixtures.

M. BERTHELOT also considers the reciprocal actions between alkali haloid salts and haloid acids; he shows that as a rule alkali chlorides are decomposed by hydrobromic acid, but that in some cases and under special conditions of temperature, bromides are decomposed by hydrochloric acid. The general results are shown to be in keeping with the laws of thermochemistry. That action in which most heat is evolved occurs, but the products of the action may be unstable under experimental conditions, and hence the primary change may be modified, or even reversed.

M. MÜNTZ states that his investigations have shown that traces of alcohol exist in all natural waters, whether rain, river, sea, or snow water. He describes his method of applying the iodoform test for alcohol, whereby one part can be detected in 1,000,000 parts of water.

PHYSICAL NOTES

M. LAURENT of Paris has constructed "magic mirrors" giving similar effects to those brought from Japan, but of glass silvered at the back instead of metal. By engraving patterns at the back and silvering the front surface, the mirror has a perfectly plane surface only when the air-pressures at the front and back are equal. If the air behind be compressed or rarefied the thinner parts will have relatively a greater convexity or concavity than the rest, and in the disk of light which the mirror reflects on to a wall from a luminous point the pattern engraved on the back will accordingly appear dark or light.

FROM experiments on the radiation and conduction of heat in rarefied gases (*Wied. Ann.*, No. 13) Herr Graetz finds the results in much better agreement with Stefan's law of radiation than with that of Dulong and Petit, and "it may be affirmed that in the temperature-interval from 0° to 250° C. the radiation is very nearly proportional to the fourth power of the temperature." The factor of proportionality σ (in Stefan's formula $Q = \sigma T^4$) is then that amount of heat which is radiated from one square centimetre of a substance of − 272° C. in a second towards a space of the absolute temperature 0° (− 273°). By the method of least squares Herr Graetz finds

$$\sigma \text{ for glass} = 1\cdot0846^{-12} \frac{\text{gramme centigrade}}{\text{centim. seconds}}.$$

Certain divergences at low temperatures suggest that while the intensity of radiation grows with rising temperature, it perhaps grows differently for different heat colours.

IN a recent communication to the Munich Academy, Herren Nies and Winkelmann describe an inquiry into the volume-changes of various metals in solidifying. Of eight metals examined, six (viz. tin, zinc, bismuth, antimony, iron, and copper) were proved to undergo expansion in passing from the liquid to the solid state. For three of the metals approximate values for the amount of this expansion were obtained (tin showed an expansion of 0·7 per cent., zinc 0·2, and bismuth 3). Two metals (lead and cadmium) gave doubtful results; but the authors find some reason to believe that they also expand in solidifying. So far then the rule would appear to be general for metals.

M. TRÈVE describes in the *Comptes rendus* some curious observations from which it would appear that when light is admitted from a natural or artificial source through a slit, more light passes if the slit be horizontal than if it be vertical. M. Trève has produced photographs taken behind slits in various positions to prove that the effect is not an illusion of the eye. The phenomenon appears to us inexplicable, but certainly requires further proof to substantiate its reality.

M. MERCADIER still continues to study radiophonic phenomena. He finds it possible to increase the effects by uniting in one tube the vibrations of several receiving disks. He also finds it possible to construct tubes whose length corresponds to the wave-length of the vibrations radiophonically excited, and which respond to the note emitted. M. Mercadier hopes by these means to re-determine with increased accuracy the velocity of sound in air and other gases.

WITH regard to the beats and beat-tones of harmonic intervals Dr. Koenig argues (*Wied. Ann.* No. 3) against Prof. Helmholtz's view, that these are due to harmonic tones of the lower primary sounding with the higher (Dr. Koenig, in his former experiments, having used strongly-excited tuning-forks). He shows how the phenomena may be studied with the aid of a "wave-syren," in which a blast of air is sent through a slit against the serrated border of a rotating disk, or of a ring-section of a thin cylinder. He has the border of the disk cut to represent accurately the curve produced by combination of the curves of two simple tones, giving an air-motion, when blown against, quite like that from the two tones sounded together. The beats and beat-tones are then heard. With a mere wavy outline for the border and the slit at right angles one hears a quite simple tone, which however is at once changed to a "clang" with strong overtones, when the slit is slanted a little. Now, with two simple tones got thus the beat-tone heard when the slits are at right angles should (on Helmholtz's supposition) be less distinct than when, the slits being slanted, the overtones are brought out; whereas the reverse is the case.

DR. KOENIG, in the same number, describes a simple lecture-apparatus for producing beat-tones. It consists of two glass rods of different length, clamped in vertical position by the middle to a jointed frame, which, through an elastic contrivance, keeps their lower ends pressed against the cloth-covered periphery of a wheel which dips in water in a trough. The friction calls forth the longitudinal tones and the beat-tone.

AN improved form of the Töpler air-pump has been devised by Herr Bessel-Hagen (*Wied. Ann.* No. 3), with which considerably higher vacua can be reached than those Mr. Crookes obtains with the more complicated and fragile Sprengel-Gimingham apparatus. The average limit of rarefaction was found to be $\frac{1}{17}$ millionths of an atmosphere ($\frac{1}{38}$ in one case), while the other pump only gives $\frac{1}{10}$ millionth. (It is noted that Prof. Ogden Rood has obtained $\frac{1}{50}$, and in one case even $\frac{1}{118}$ with a modified Sprengel.) With his highest vacua the author found electricity to pass (using plate-electrodes and a strong Holtz machine, with Leyden jars). He considers mercury-vapour an insulator for electricity; but shows that radiometric movements depend greatly on its pressure *in vacuo*. No diffusion of hydrogen through the glass could be detected.

AN artificially-formed body showing polar effects in the way of attraction and direction is produced by Herr Holtz (*Wied. Ann.*, No. 3) thus: To one end of a short glass rod is cemented a plane piece of glass, and to this a short narrow glass tube (in a line with the rod). In the tube is placed a sewing-needle longer than it, and carrying at its head a thin pasteboard disk (22 mm. across), which has attached on one half of its periphery, reaching over both above and below, a pasteboard strip (10 mm. broad); opposite this, on one of the surfaces, is fastened a small projecting point of tin-foil. Brought between hollow disks fixed to the rods of a Holtz machine, the tin-foil point always turned to the positive pole. Next, the glass rod with its disk was attached to the end of a light horizontal glass tube, hung bifilarly, and so brought between the hollow disks. The disk first turned into position, and was then attracted towards the negative pole. The phenomena are thought to illustrate unipolar conductivity.

THE simple tourmaline-pincette, by reason of its small field, can be used with only a small number of crystals. To enlarge the field M. Bertin has applied to it a part of the lenses of the polarising microscope. This, it is known, consists, first, of a polariser and focus; second, of a microscope and analyser. The polariser and analyser, at the extremities, are pretty large pieces, and if replaced by two tourmalines placed between the focus and the microscope (of simplified form) the apparatus is rendered much smaller and handier. This is the principle of M. Bertin's new tourmaline-pincette (of which details will be found in the

Journal de Physique for March). It shows very well the fringes of a crystal only 2 mm. in diameter and ¼ mm. in thickness, and all uniaxial crystals give fringes in it. With the old pincette only two biaxial crystals can be observed (nitre and lead crystal), the limit for the exterior angle of the axis being about 17°; but in the new instrument, a small calamine plate, with axes 78° 20′ apart, showed the fringes well.

ACCORDING to M. Angot (*Jour. de Phys.*, March) the psychrometer, of whatever form, may give pretty good indications in the hands of careful observers, in these regions (France), so long as the atmospheric pressure is not far from 760 mm., the wet bulb thermometer is above 1° or 2°, and the difference of the two thermometers remains below 12°; but otherwise the ordinary formulæ become illusory.

THE influence of atmospheric electricity on the vegetation of the vine has been studied near Palermo by M. Macagno (*Jour. de Agr. Prat.*) thus: Sixteen stocks were rendered more subject to the effects of the electric tension by means of a copper wire inserted vertically with platinum point in the upper end of the fruit branch, while another wire connected the bottom of the branch with the ground. This continued from April to September. An acceleration of vegetation was proved by the wood of these stocks containing less mineral matters and potash than that of the other stocks, while the contrary occurred in the leaves, and in these the potash was mostly in the bitartrate form. A much greater quantity of must was got from the grapes of those vines, and it had considerably more glucose and less acid.

A DETERMINATION of the electric phenomena which occur on contact of metals and gases has been attempted by Herr Schulze-Berge in Berlin (*Wied. Ann.* No. 2). He worked with a condenser having two circular plates of a given metal, the upper plate being connected with an electrometer and submitted to contact with various gases or to vacuum; the lower connected to earth. The quantity of electricity from a known source requiring to be communicated to the upper plate to make its potential equal to the lower, was measured. *Inter alia*, ozone was found to make gold, platinum, and brass negative to a plate of the same metal in air. Hydrogen always made platinum strongly positive, while its influence on gold was hardly perceptible, and on brass qualitatively various. Chlorine made platinum negative; ammoniacal gas (from aqueous solution) made brass positive. The amount of difference of potential with as similar treatment as possible of a given pair of plates was very different in the several observations of a series. Nor could a certain relation be discovered between it and the time of action of the gas. It was greatest with two platinum plates, one in hydrogen (viz. 0·214 D). It gradually decreased to a point generally somewhat short of that at the beginning. As to the cause of this decrease, the auther thinks it probable that a gradual neutralisation of the electrical double layer takes place.

THE DEVELOPMENT OF HUMAN INTELLIGENCE

THE Department of Education of the American Social Science Association has issued the following Circular and Register, which we commend to the notice of our readers, some of whom may be able to give Mrs. Talbot answers to the questions given below:—

WE have been made familiar with the habits of plants and animals from the careful investigations which have from time to time been published—the intelligence of animals, even, coming in for a due share of attention. One author alone contributes a book of one thousand pages upon "Mind in the Lower Animals." Recently some educators in this country have been quietly thinking that to study the natural development of a single child is worth more than a Noah's ark full of animals. Little has been done in this study, at least little has been recorded. It is certain that a great many mothers might contribute observations of their own child's life and development that might be at some future time invaluable to the psychologist. In this belief the Education Department of the American Social Science Association has issued the accompanying Register, and asks the parents of very young children to interest themselves in the subject—

1. By recognising the importance of the study of the youngest infants.
2. By observing the simplest manifestations of their life and movements.
3. By answering fully and carefully the questions asked in the Register.
4. By a careful record of the signs of development during the coming year, each observation to be verified, if possible, by other members of the family.
5. By interesting their friends in the subject and forwarding the results to the secretary.
6. Above all, by *perseverance* and exactness in recording these observations.

From the records of many thousand observers in the next few years it is believed that important facts will be gathered of great value to the educator and to the psychologist.

speak, and what did it say? ....

HOW MANY WORDS COULD IT SAY

at 1 year? .... at 18 months? .... at 2 years? ....

Will the mother have the kindness to carefully answer as many as possible of these questions and return this circular, before July 15, 1881, to Mrs. Emily Talbot, Secretary of the Education Department of the American Social Science Association, 66, Marlborough Street, Boston, Mass.

Boston, March 1, 1881

In connection with the inquiry indicated above, the following letter from Dr. Preyer of Prussia, addressed to Mrs. Talbot, will be found of interest:—

Jena, November 22, 1880

DEAR MADAM,—It has given me much pleasure to read your letter and the extract of a paper of mine on "psychogenesis," or "the growth of volition, intellect, &c., in infants," and I readily comply with your wish to have this paper sent off without delay. You will find it reprinted in the book accompanying this letter, p. 199–237. I am about to publish an extensive work on the same subject, which is to contain all my observations and a careful analysis of the phenomena which the development of the faculty of speech presents. This book is to be printed next year. I am sorry to say that a reliable investigator of the whole subject is not known to me. Your newspaper seems to be right in calling the field "as yet almost unbroken." Prof. Kussmaul's "Seelenleben des neugeborenen Menschen" (Leipzig and Heidleberg, 1859), and Mr. C. Darwin's biographical sketch of an infant, contain some good observations, but both are very short. Many excellent remarks on infants and very young children I find in Mr. C. Darwin's book, "On the Expression of the Emotions." The German books on the subject, although numerous, are nearly worthless; many are sentimental, giving no facts, or, what is worse, false statements. B. Sigismund's "Kind und Welt" (1851) is an exception.

The case you mention of a child of eleven months expressing its wishes and inducing the nurse to comply with them cannot be definitely looked at as a case of self-consciousness, but only of consciousness. This is one of the most intricate questions to decide—*when* the child distinguishes its own body, head, hands, &c., from other objects, as belonging to himself. The first time, a child says "I" and "me," in the correct sense, it may be considered to have passed the limit. The formation of ideas by associating impressions, as well as the formation of general ideas (*Begriffe*) by uniting similar qualities of different objects, is intellectual work done by the child long before it knows anything of its own individuality. It seems to me that self-consciousness does not arise suddenly, but by degrees, after many experiments have shown the difference between touching his own body and external objects with his little hand.

I have been occupied with psychogenetical problems since nearly four years, continually collecting facts. Should you be able to awaken some interest for there most important investigations (I mean the physiology and psychology of infants), I think the trouble taken would soon be repaid by the results.

I am, sincerely,

Dr. Wm. Preyer, Professor

P.S.—Perhaps the observations and experiments on the senses (sight, hearing, smell, taste) of new-born animals and infants which I published in *Kosmos* (Zeitschrift herausgegeben von E. Krause), vol. iii. pp. 22–37, 128–132 (1878, Leipzig), may have some little interest. In England Romanes has written very able papers on the development of instinct and intelligence. His address is 18, Cornwall Terrace, Regent's Park, London.

Yours, &c., W. P.

ABNORMAL BAROMETRIC GRADIENT BETWEEN LONDON AND ST. PETERSBURG IN THE SUN-SPOT CYCLE

BEFORE alluding to the subject which forms the heading of the present communication, I must apologise for having allowed some rather serious errors to creep into the figures given for the barometric abnormals of London in my letter to NATURE, vol. xxiii. p. 243. The errors were caused by a friendly computer taking the differences from the mean for each year incorrectly in one or two cases.

I am glad to say however with respect to the relation between the barometric abnormals as there given and the sun-spot numbers, that far from its being vitiated by the corrections which have now been made, they on the contrary considerably strengthen it, as is evident when the following corrected values for the mean cycles are compared with those given in my former letter:—

LONDON

Annual Barometric Abnormals, Mean Cycles

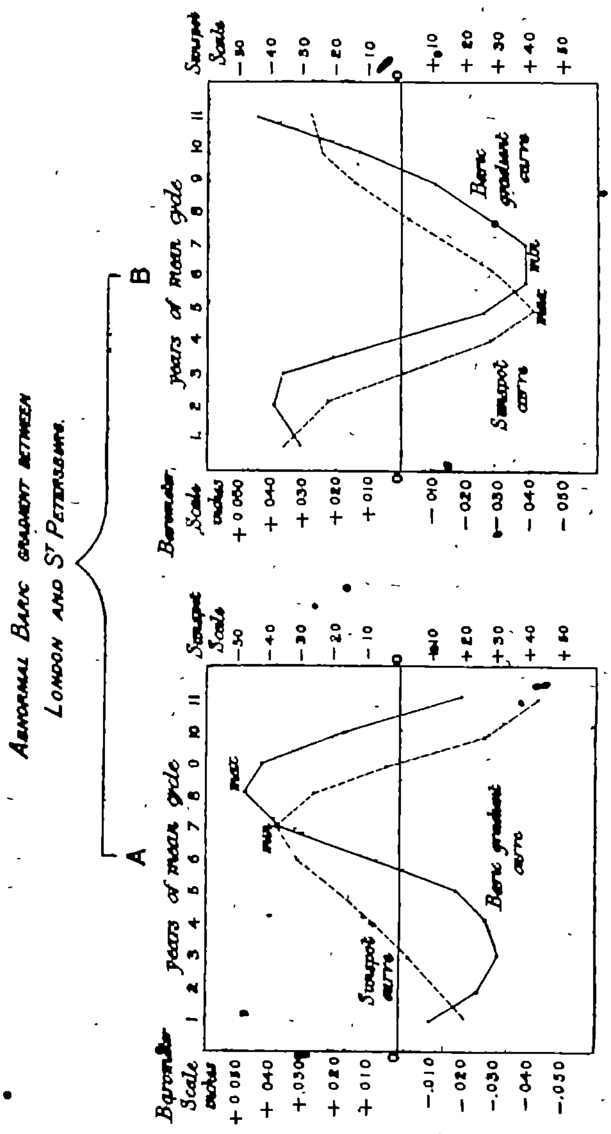
	Maximum years in fifth line. Pressure (1811–77)		Maximum years in fifth line. Sun-spots (1811–77).		Minimum years in seventh line. Pressure (1816–79).		Minimum years in seventh line. Sun-spots (1816–72).
1.	+0·011	...	−33·9	...	−0·006	.	+23·3
2.	+0·024	...	−23·4	...	−0·003	...	+14·5
3.	+0·017	...	0·0	...	−0·002	...	+ 4·8
4.	−0·003	...	+28·2	...	−0·004	...	− 5·6
5.	−0·011	...	+43·1	...	−0·006	..	−19·0
6.	−0·012	...	+34·2	...	−0·002	...	−32·5
7.	−0·008	...	+16·8	...	+0·003	...	−37·1
8.	±0·000	...	+ 0·2	...	+0·020	..	−25·4
9.	+0·002	...	−14·2	...	+0·025	...	+ 1·8
10.	+0·010	...	−24·2	..	+0·010	...	+30·9
11.	+0·008	...	−26·3	...	−0·009	...	+44·8

If now we take these corrected figures, and subtract from them those given in NATURE, vol. xx. p. 28, for St. Petersburg (reduced to inches), which comprise very nearly the same period, we get for the abnormal annual baric gradient from London to St. Petersburg in each year of the mean cycle, the following figures:—

Abnormal Annual Barometric Gradient between London and St. Petersburg

	(B) Maximum years in fifth line. Pressure. London–St. Petersburg (1811–77). (18[illegible]-71). Inches.		(B) Maximum years in fifth line. Sun-spots (1811–77).		(A) Minimum years in seventh line. Pressure. London–St. Petersburg (1816–79). (18[illegible]-71). Inches		(A) Minimum years in seventh line. Sun-spots (1816–72).
1.	+0·032	...	−33·9	...	−0·012	...	+23·3
2.	+ ·038	...	−23·4	...	− ·027	...	+14·5
3.	+ ·036	...	0·0	...	− ·033	...	+ 4·8
4.	+ ·007	...	+28·2	...	− ·029	...	− 5·6
5.	− ·029	...	+43·1	...	− ·018	...	−19·0
6.	− ·040	...	+34·2	...	+ ·010	...	−32·5
7.	− ·040	...	+16·8	...	+ ·036	...	−37·1
8.	− ·025	...	+ 0·2	...	+ ·048	...	−25·4
9.	− ·012	...	−14·2	....	+ ·041	...	+ 1·8
10.	+ ·013	...	−24·2	...	+ ·016	...	+30·9
11.	+ ·043	...	−26·3	...	− ·018	...	+44·8

An inspection of these figures at once reveals the existence of a baric gradient oscillation of single period, closely following the inverse sun-spot oscillation.



In order to exhibit the constancy of the lag in the occurrence of the gradient variations behind those of the sun-spots, as well as the remarkable similarity in form of the two oscillations, I have reproduced the above figures graphically in the accompanying diagram, in which the baric gradient abnormals are plotted out simultaneously with the *inverted* sun-spot abnormals:—

It will be observed that there is an almost uniform lag in the baric gradient curve behind the inverted sun-spot curve of a little more than a year, while a variation of ·01 inches on the barometer scale corresponds very nearly throughout (allowance being made for the lag) to 10 on the sun-spot scale.

As the strength of the prevailing west and south-west winds of these regions must necessarily depend on the amount of the baric gradient between places on the edge of the European continent like London, and those inland, and to the north as St. Petersburg, there is fair ground for concluding that the west and south-west winds must on the whole be stronger in years of minimum sun-spot than in those of maximum sun-spot.

Some direct evidence in favour of this notion has already been communicated to NATURE by Mr. S. A. Hill and Mr. Ellis of the Greenwich Observatory.

Moreover the amount of variation in the strength of the wind between London and St. Petersburg, following upon the change in the barometric gradient between the two during the cycle, should be enough to cause a *sensible* variation in the character of the weather; for according to Mr. Blanford the mean barometric gradient over the Bay of Bengal during the south-west monsoon is about 0·025 inches in 100 miles.

Now as the distance from London to St. Petersburg is about 1300 miles; in order to maintain a current of air between them throughout the year equal to that of the summer monsoon in the Bay of Bengal, there would have to be a total annual barometric gradient of 0·0325 inches. As the range of the abnormal gradient in the present case amounts to 0·08 inches it should cause a variation in the wind equal to one-fourth that of the monsoon.

For the period 1822-71 the normal mean annual gradient from London to St. Petersburg is + 0·098 inches. The variation of the abnormal is therefore nearly equal to the normal gradient.

Taking the results just obtained with those given by Mr. H. F. Blanford in his article in NATURE, vol. xxi. p. 477, it may be concluded that there is a barometric "see-saw" between Russia and Western Siberia and the Atlantic coasts of Europe, similar to that between the former districts and Indo-Malayana.

Just as in the latter case the relation will probably be found to be more marked in the winter months, and may also be found to explain some of the numerous facts already ascertained regarding variations in the rainfall, cloud, and temperature of Western Europe, at different epochs of the sun-spot cycle.

E. DOUGLAS ARCHIBALD

CONGRESS OF THE FRENCH LEARNED SOCIETIES

THE session of the Congress of the French Learned Societies has lasted only three days, but has exhibited an unusual amount of interest. Many papers were read in the section of Science presided over by M. Milne-Edwards, the veteran member of the Institute.

M. Alluard summarised the results of rotation of the wind as registered by anemometers at an altitude where it is not to be feared that surface-friction should interfere. The number of rotations from north to south was 113. Of these 83 were in the positive direction, or by east, and only 30 by west; 49 of the 83 positive were continued to the west, and 34 stopped at the south or vicinity; consequently when a wind has come from north to south by east, the greater probability is that it will continue rotating to the west. When it has rotated to the west the probability is even greater that it will continue to the north. Again, of the 49 three-quarter rotations observed not less than 32 were completed, and only 17 stopped at the west and vicinity. The same thing cannot be said of the negative rotations: only 13 were from north to east, and of these only 6 were from north to north by west. These results are a confirmation of Dove's well known law.

General Nansouty, the director of the Pic-du-Midi Observatory, announced that the new buildings on the top of the mountain will soon be ready, and that next winter he will use them for taking readings. It is curious that the last winter has been one of unusual mildness in this exalted altitude.

M. Hébert read a long paper on the formation of cyclones, which he explains by the influence of mountain ranges on the great atmospheric currents loaded with humidity.

M. Vidal presented a photometer based on the action of light on a selenium element of the ordinary construction. M. Vinot, editor of *Le Ciel*, presented a refractor mounted equatorially, of which the price is less than 10*l*.; with a magnifying power of 150. M. Joubert gave details on the working of the Trocadéro Popular Observatory, which is now in constant operation, and where lectures on astronomical subjects are delivered regularly.

M. Guillemare read a paper on the use of saleine for lighting purposes. This product has been obtained by the distillation of a number of resinous matters, which have a point of ebullition from 150 to 160 Centigrade and a mean density of 0·860. When they have been freed from every other matter they can be used in a specially-prepared burner. This saleine can be prepared in immense quantities in all countries where pines are abundant.

A number of interesting communications were made on palæontology and zoology, generally advocating Darwinian views.

The final sitting was presided over, as usual, by the Minister of Public Instruction, and took place in the large hall of the Sorbonne. A number of crosses of honour and medals were distributed.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

OXFORD.—The lectures of the summer term commence this week. At the University Museum Prof. Clifton will conduct a class in practical physics and will lecture informally on the use of optical instruments. Mr. Stocker will give an experimental lecture in mechanics, and Mr. V. Jones will lecture on mechanical problems, in continuation of their courses last term. Prof. Odling will continue his course of lectures on organic chemistry, and Mr. Fisher will finish his inorganic course.

At Christ Church Mr. Harcourt lectures on the metals, and Mr. Baynes on the theory of gases. At Balliol Mr. Dixon gives an experimental lecture in elementary physics.

In a Congregation holden on Tuesday, April 27, it was resolved that candidates, not being members of the University, may present themselves at any of the ordinary examinations for Responsions. Last term a statute was passed instituting an examination to take place in the Long Vacation. This examination, which can be passed by candidates before matriculation into the University, is to be passed in lieu of Responsions. The effect of the statute will be that all young men may pass Responsions before they matriculate, and less of their University time will be consumed in getting up school work.

The proposal to designate the unattached students as students of the University Hall was lost by a large majority, 90 voting against the proposal and only 9 for it.

SOCIETIES AND ACADEMIES

LONDON

Chemical Society, April 21.—Dr. Debus in the chair.—It was announced that a ballot for the election of Fellows would take place at the next meeting, May 5.—The following papers were read:—On the distillation of mixtures of carbon disulphide and carbon tetrachloride, by F. D. Brown. The objects of the research were to find the boiling-point of every possible mixture of the two liquids, and the composition of the vapour evolved by any mixture when boiling. Tables and curves giving these results accompany the paper. The author also finds that the composition of the vapour evolved is independent of the pressure under which ebullition takes place.—On the estimation of hydric peroxide by means of potassic permanganate, by W. E. Adeney.—On the oxidation of sulphurous acid, by H. P. Dixon. The author finds that when sulphur dioxide, steam, and oxygen are exposed to a temperature of 100° C. no diminution of volume takes place, and therefore no sulphhuric acid is formed. If the temperature be allowed to fall so that water condenses, a slight contraction in volume is observed.—On the reduction of cinnamic alcohol, by F. Hatton and W. R. Hodgkinson. When this substance is heated to 100° C. for three or four days with sodium amalgam (containing 15 per cent. sodium), and a small quantity of water cinnamene and methylic alcohol are produced.

Entomological Society, April 6.—W. L. Distant, vice-president, in the chair.—One Ordinary and one Honorary Member were elected.—Mr. J. Jenner Weir exhibited an undetermined *Noctua*, apparently allied to the genera *Dicycla*, or *Gortyna*, which was found in a nursery garden at Blackheath in August last.—Mr. R. McLachlan exhibited three rare species of the Neuropterous genus *Dilar*, Ramb.—Rev. A. E. Eaton exhibited a specimen of *Haplophthalmus elegans*, Schobl., a woodlouse new to the British fauna.—Miss E. A. Ormerod exhibited two termites' nests from British Guiana.—Mr. T. R. Billups exhibited specimens of two rare British insects—*Ichneumon erythraeus*, Gr., and *Lasiosomus enervis*, Herr. Schäff.—The Secretary announced the death of Herr J. H. C. Kawall, a well-known entomologist of Courland, at the age of eighty-two.—Mr. R. McLachlan read a description of a new species of *Cordulina* (*Gomphomacromia fallax*) from Ecuador.—Mr. J. B. Bridgman communicated a paper entitled "Some Additions to Mr. Marshall's Catalogue of British *Ichneumonidæ*." Upwards of sixty species (most of which were exhibited to the meeting) were noticed as new to the British fauna, including thirteen new to science.

Meteorological Society, April 20.—Mr. C. Greaves, F.G.S., vice-president, in the chair.—W. H. Goss, F.G.S., and Admiral L. L. Maxse were elected Fellows of this Society.—The following papers were read:—On the frequency and duration of rain, by Dr. Wladimir Köppen of Hamburg.—Results of experiments made at the Kew Observatory with Bogen's and George's barometers, by G. M. Whipple, B.Sc., F.R.A.S.—On a discussion of Mr. Eaton's table of the barometric height at London with regard to periodicity, by G. M. Whipple, B.Sc., F.R.A.S.

Anthropological Institute, April 12.—F. W. Rudler, F.G.S., vice-president, in the chair.—The election of Lieut.-Col. R. G. Woodthorpe, R.E., and of Thomas Vincent Holmes, F.G.S., was announced.—Mr. Joseph Lucas read a paper on the ethnological relations of the Gypsies. In tracing back the past history of the races described under the common name of Gypsies we pass through two periods—the first *historical*, dating from A.D. 1414; the second partly historical, partly inferential. This older section formed the subject of Mr. Lucas's paper. The author premised that linguistic evidence shows that the various tribes of Gypsies now scattered over Europe can be referred to several Eastern tribes from India to Persia. The investigation dates back to archæological times, especially in relation to the working of metals and the presence of a large number of pure Sanscrit words in the language of European Gypsies, many of which do not occur in Hindustani. The "archæological" section embraces all that was not included under the several sections—"The Gypsies in Egypt," "Gypsies among the Romans," or "The Dark Ages"; but a good deal of the evidence upon which the archæological conclusions rest runs through those several sections, as well as through sections specially devoted to the names *Zingaro* and *Rom*. It will thus appear that the term "Gypsy" is used by the author in the widest sense as meaning "an Asiatic tribe which has wandered into Europe," though strictly it should mean only those who came by way of Egypt.

PARIS.

Academy of Sciences, April 18.—M. Wurtz in the chair.—The following papers were read:—Microscopic inscription of movements observed in physiology, by M. Marey. The accuracy of the curves from M. Marey's instruments has been doubted, on the ground that vibrations proper to the light lever may be added to the physiological movement. He now removes this objection by greatly diminishing the range and velocity of the lever, so as to give microscopic curves on smoked glass (which is also moved more slowly). The inertia of the lever becomes negligible. The curves, when examined in the microscope or by projection, are found identical with the others. The method greatly extends the field of phenomena that may be registered; *e.g.* the vibrations of blood in the vessels, which give a sound, produce a distinct microscopic trace. The portable character of the apparatus is an advantage.—On the Eulerian integral of the second species, by M. Gyldén.—On the surface of Kummer with sixteen singular points, by M. Brioschi.—On the action of heat on ammoniated bases, by M. Hofmann.—Report on a memoir of M. Perissé, entitled "Causes which tend to warp the Girders of Iron Bridges, and Means of Calculating these Girders for Resistance of Warping Forces."—On the secondary battery of M. Faure, by M. Reynier. This is an improvement on M. Planté's. M. Faure quickly gives his couples a power of almost unlimited accumulation by covering the lead electrodes with a layer of spongy lead formed and retained thus: The two sheets of lead are each covered with minium or other insoluble oxide of lead, then with a felt envelope held by lead rivets. They are then placed near each other (in spiral, it may be) in acidulated water. The electric current changes the minium to peroxide on the positive electrode, and to reduced lead on the negative. On discharging, the reduced lead is oxidised and the peroxidised lead reduced. A quantity of energy capable of giving 1-horse power for one hour may be had with a Faure battery of 75 kg. The battery, under certain conditions, returns 80 per cent. of the work expended in charging it.—A letter from Ampère to Lacroix was read. It was written when he was Professor in the Lyceum of Lyons, and expresses his enthusiasm for mathematical studies.—On the earthquake of Chio, by M. de Pellissier, Consul-General at Smyrna. The amplitude of the first oscillation, on the afternoon of April 3, was estimated to be between 0·15 m. and 0·20 m. From then till the 5th 250 shocks were felt, thirty or forty of which were capable of throwing down a solid wall. All the oscillations were in the direction east to west. The Governor's palace, of very light construction, but chained throughout at the level of each storey, resisted all the shocks, while the wall inclosing the grounds, 0·70 m. thick, was everywhere thrown down. Smyrna has become a refuge for the wounded.—On Fuchsian functions, by M. Poincaré.—On Abelian functions, by the same.—On a class of functions, the logarithms of which are sums of Abelian intervals of the first and third species, by M. Appell.—On the formulæ of representation of functions (continued), by M. Du Bois-Reymond.—On stellar photography, by Prof. H. Draper. By exposing 140 minutes in the telescope, he has succeeded in photographing stars of magnitude 14·1, 14·2, and 14·7 (Pogson's scale) in the nebula of Orion; the weakest is of the sixteenth magnitude on Herschel's scale. The minimum of visibility for the 9-inch telescope used has been thus nearly reached, and Prof. Draper hopes soon to be able to go still further. The nebula extends over a surface about 15′ in diameter.—Action of electrolysis on toluene, by M. Renard.—Structure and comparative texture of the ink-bag in cephalopoda of the French coasts (continued), by M. Girod. The species observed were *Sepia officinalis*, *Loligo vulgaris*, *Sepiola Rondeleti*, and *Octopus vulgaris*.—On the large dunes of sand of the Sahara, by M. Rolland. These dunes move toward the south-east, and the sum of sand is increased by disaggregation of rocks; but the movement and increase are almost insensible in a generation.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"*To the solid ground*
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 575, Vol. 23] THURSDAY, NOVEMBER 4, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

GRAHAM MEDAL.

The TRIENNIAL GOLD MEDAL of the Chemical Section of the Philosophical Society of Glasgow, founded in commemoration of the work of Thomas Graham, F.R.S., late Master of the Mint, will be awarded at the end of the present Session for the Best Paper on any subject in Pure or Applied Chemistry.

Authors are requested to send in their Papers, not later than 1st February, 1881, addressed to the Secretary of the Section, Dr J. J Dobbie, Chemical Laboratory, University of Glasgow.

MINING.—ROYAL SCHOOL of MINES,

JERMYN STREET.—Mr. WARINGTON W. SMYTH, M.A., F.R.S., will commence a Course of Sixty Lectures on Mining, at half-past 3 o'clock, p.m., on MONDAY next, November 8th, to be continued at the same hour on each succeeding Tuesday, Thursday, Friday, and Monday. Fee for the Course, £4

F. W. RUDLER, Registrar.

APPRENTICESHIP SCHOOL OF MECHANICAL ENGINEERING.

Superintendent of Workshops S. PICHLER, Esq. Lectures by JOHN BOURNE, Esq (Author of various Works on the Steam Engine), by Mr. LAWRIE, Past President of Institute of Engineers and Shipbuilders in Scotland. For particulars apply to Secretary, Polytechnic, 309, Regent Street, London.

"CHALLENGER" EXPEDITION,

MICROSCOPIC PREPARATIONS FROM,
Per Sir Wyville Thomson.

24 Soundings correctly marked, Lat., Long., Depth, &c., in Box, 30s.

Also, 24 Injected Preparations Illustrating Anatomy of the Monkey, in Box, 21s.

To be had of J. T NORMAN, 178, City Road, E.C., about 100 yards north of Old Street

A large variety of Specimens in all Branches of Microscopy.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *via* SHEFFIELD.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

EAGLE INSURANCE COMPANY,

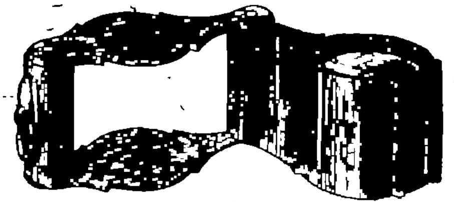
79, PALL MALL.
For Lives only. Established 1807.

Accumulated Funds £3,043,542
Also a Subscribed Capital of more than £1,500,000

Reports, Prospectuses, and Forms may be had at the Office, or from any of the Company's Agents, post free.

GEORGE HUMPHREYS, Actuary and Secretary.

BROWNING'S PLATYSCOPIC LENS.



Engraved Real Size.

A NEW ACHROMATIC COMBINATION,

COMBINING THE DEFINITION OF A MICROSCOPE WITH THE PORTABILITY OF A POCKET LENS.

The Platyscopic Lens is invaluable to botanists, mineralogists, or entomologists, as it focuses about three times as far from the object as the Coddington Lenses. This allows opaque objects to be examined easily.

The Platyscopic Lens is made of three degrees of power, magnifying respectively, 15, 20, and 30 diams., the lowest power, having the largest field, is the best adapted for general use.

The Lenses are set in Ebonite Cells, and mounted in Tortoiseshell Frames.

Price of the Platyscopic Lens, mounted in Tortoiseshell, magnifying either 15, 20, *or* 30 *diameters*, 18*s*. 6*d*.

Illustrated description sent free.

JOHN BROWNING, 63, STRAND, LONDON, W.C.

SUNSHINE RECORDER,

Of the form adopted by the Meteorological Council of the Royal Society, and supplied to more than thirty of their Stations, as well as to several private Observatories.

JORDAN'S GLYCERINE BAROMETER,

In which the Inch of the ordinary Barometer is expanded to nearly Eleven Inches, and which is in successful use at the Kew Observatory, at the *Times* Office, the Geological Museum, Jermyn Street, and other places.—See the *Times* of October 25th.

For information, cost, &c., apply to R. J. Lecky, care of Kirkland, Cope, and Co., 23, Salisbury Street, Strand, London.

FOR SALE.—"NATURE" (Unbound).—

Vols 16, 17, 18, and 21, and Nos. 471, 472, 473 (of Vol. 19), and Nos. 512–522 (of Vol. 20), and No. 549.—Reader, 29, Bedford Street, Nature Office

MUSEUMS AND COLLECTORS.

Mr. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS of ORANGITE, ENSTATITE, BREVICITE, EUXENITE, AUGITE, PYROSMALITE.

UNIQUE SPECIMENS of ADULARIASPHENE and SMOKY QUARTZ.

FINE CRYSTALLISED CROMFORDITES and MATLOCKITE, Derbyshire.

XENOTINE CRYSTALLISED, Valais; WOLLASTONITE CRYSTALLISED.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra; Ground edged Slips, 5s. per gross; also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d.; six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic point. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liège, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter.

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription: Twenty-five Shillings, or Twenty-seven Shillings post free.

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London.

In the first two numbers have appeared:—

VAN BENEDEN: On the Embryology of the Mammalia.

VAN BAMBEKE: On the Cleavage of the Egg in Batrachia.

FOETTINGER: On the Termination of Nerves in the Muscles of Insects.

FREDERICQ AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.

MACLEOD: On the Harderian Gland of the Duck, &c., &c.

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects. Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least; frequent supplements and drawings. Subscription at any time; preceding numbers of the year furnished subsequently. Price 12*s.* for twelve months. Advertisements 4*d.* a line, widely spread by this paper; considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall, 28. Edited by W. v. FREEDEN, M.R., Hamburg, Alexander Street, 8.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s.* each; the succeeding vols. may be had separately or together, at 7*s.* each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

On the 1st of every Month, price Sixpence

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,

With the Assistance of

FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

HOLLOWAYS OINTMENT A CERTAIN REMEDY

For BAD BREASTS, OLD WOUNDS, and SORES. If effectually rubbed on the Neck and Chest, it cures SORE THROATS, BRONCHITIS, COUGHS and COLDS; and for GOUT, RHEUMATISM, and all Skin Diseases it is unequalled.

Original Popular Work upon the Natural History of Tasmania.

TASMANIAN FRIENDS & FOES; FEATHERED, FURRED, AND FINNED.

By MRS. LOUISA A. MEREDITH,

Author of "My Home in Tasmania," "Some of my Bush Friends in Tasmania," "Our Island Home," &c., &c.

ILLUSTRATED BY EIGHT COLOURED PLATES FROM DRAWINGS BY THE AUTHOR, AND NUMEROUS WOODCUTS.

In this book the Author has gathered and woven into connected sequence some of the most interesting incidents and observations which a residence of thirty-nine in years in Tasmania has served to collect. Every adventure narrated is strictly true, and the anecdotes of birds and animals are facts, set down simply from the experience of the Author and her family.

The Author confutes the statement generally accepted by Naturalists, that the Marsupials, in accordance with their low development of brain, show a low degree of intelligence.

Quarto, Gilt Edges, handsomely bound in Cloth, price 21s.

London: MARCUS WARD & CO., 67 and 68, Chandos Street; and Royal Ulster Works, Belfast.

Now ready, post quarto, cloth gilt, 272 pages. Price 16s.

LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,

Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the persons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street. 1880.

Small 8vo, 12s.

ZOOLOGICAL CLASSIFICATION:

A HANDY BOOK OF REFERENCE.

Second Edition, with Additions and a Glossary.

By FRANCIS P. PASCOE, F.L.S., &c.

"An exceedingly valuable compendium of zoology."—*Popular Science Review.*

DIARY OF SOCIETIES.

LONDON

THURSDAY, NOVEMBER 4.

CHEMICAL SOCIETY, at 8.—On the Compounds of Vanadium and Sulphur: E. W. E. Kay.—Report on the Atmospheric Oxidation of Phosphorus and on some reactions of Ozone and Peroxide of Hydrogen: C. T. Kingzett.—Action of Heat on the Mixed Vapours of Benzene, Toluene, &c.: Dr. T. Carnelley—Bismuth and Bismuth Compounds. Part 1, Oxides and Hydrates; Part 2, Halogen Compounds: M. M. Pattison Muir, G. B. Hoffmeister, and E. E. Robbs.—On the Colour Properties and Relation of the Metals Copper, Nickel, Cobalt, Iron, Manganese, and Chromium: T. Bayley.—Action of Diazo-naphthalin upon Salicylic Acid: Dr. Percy Frankland—Action of Organo-Zinc Compounds upon the Nitriles and their Analogues: Dr. E. Frankland, F.R.S., and C. C. Graham.—Action of Zinc Ethyl on Benzoylic Cyanide: Dr. E. Frankland and D. A. Louis.—On the Basic Sulphates of Iron: Spencer Pickering. —Fourth Report on Researches in Chemical Dynamics. Sec I.: Dr. C. R. A. Wright; Sec. II. and III.: Dr. C. R. A. Wright and A. E. Menke. —On some Naphthalin Derivatives: Dr. Armstrong and N. E. Graham.

LINNEAN SOCIETY, at 8.—Additions to our knowledge of the Flora of North-West India: Prof. G. Watt.—The Papilionidæ of South Australia: J. G. Otto Tepper.—On Flowering Plants from Madagascar: J. G. Baker.

FRIDAY, NOVEMBER 5.

GEOLOGISTS' ASSOCIATION, at 8.—The Geologists' Association; its Origin and Progress: Prof. Rupert Jones.

MONDAY, NOVEMBER 8.

GEOGRAPHICAL SOCIETY, at 8.30—Journey in East and Central Africa: J Thomson.

ARISTOTELIAN SOCIETY, at 8.—Bacon: W. A. Casson.

TUESDAY, NOVEMBER 9.

WEST LONDON SCIENTIFIC ASSOCIATION, at 8.

PHOTOGRAPHIC SOCIETY, at 8.

ANTHROPOLOGICAL INSTITUTE, at 8.—On Anthropological Colour-Phenomena in Belgium and elsewhere: J. Beddoe, F.R.S.—On Different Stages in the Development of the Art of Music in Prehistoric Times: J. F. Rowbotham.—On Neolithic Implements in Russia: Prince Paul Poutiatin.

WEDNESDAY, NOVEMBER 10.

SOCIETY OF TELEGRAPH ENGINEERS, at 8.

ROYAL MICROSCOPICAL SOCIETY, at 8.—Notes on some Acanthometridæ: Chas Stewart.—A New Working Microscope: Dr. Carpenter, C B.

EPPING FOREST NATURALISTS' FIELD CLUB, at 8.—Forest Animals: J. E. Harting.

THURSDAY, NOVEMBER 11.

MATHEMATICAL SOCIETY, at 8.—Considerations respecting the Translation of Series of Observations into Continuous Formulæ: The President—On Bicircular Quartics, with a Triple and a Double Focus and Three Single Foci, all of them Collinear: H. M. Jeffery, F.R.S.—Further Remarks on the Geometrical Method of Reversion: Rev. C. Taylor.

FRIDAY, NOVEMBER 12.

ROYAL ASTRONOMICAL SOCIETY, at 8.

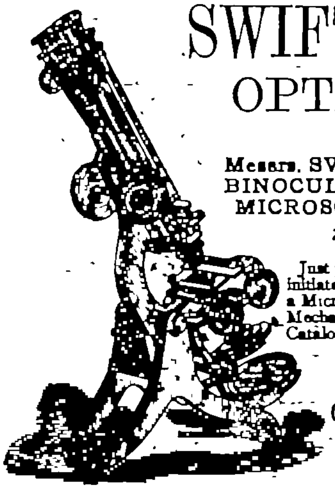
QUEKETT MICROSCOPICAL CLUB, at 8.

SATURDAY, NOVEMBER 13.

PHYSICAL SOCIETY, at 3.—On the Beats of Mistuned Consonances of the Form h : 1: R. H. M. Bosanquet.—Note on Prof. Exner's Paper on Contact Electricity: Professors Ayrton and Perry.—On Action at a Distance: Walter R. Browne.

DRAPER'S INK (DICHROIC).
THE NEW BLACK INK
DIFFERING FROM ANYTHING ELSE EVER PRODUCED.
Writing becomes a pleasure when this Ink is used. It has been adopted by the principal Banks, Public Offices, and Railway Companies throughout Ireland.
It writes almost instantly Full Black. | Flows easily from the Pen.
Does not corrode Steel Pens. | Blotting-paper may be applied at the
Is cleanly to use, and not liable to Blot. | moment of writing.
Can be obtained in London, through Messrs. BARCLAY & SONS, Farringdon Street; W. EDWARDS, Old Change; F. NEWBERY & SONS, Newgate Street; WM. MATHER, London and Manchester; J. AUSTIN & CO., Duke Street, Liverpool; and STACY & COOK, Paternoster Row; and to be had of all Stationers.
BEWLEY & DRAPER (Limited), Dublin.

The MORPHOLOGY of the SKULL. By W. K. PARKER, F.R.S., Hunterian Professor, Royal College of Surgeons, and G. T. BETTANY, B.Sc., Lecturer on Botany in Guy's Hospital Medical School. Illustrated. Crown 8vo. 10s. 6d.
MACMILLAN & CO., London.



SWIFT & SON,
OPTICIANS.
Messrs. SWIFT'S CHALLENGE BINOCULAR & MONOCULAR MICROSCOPE in Cabinet, from £14 to £18 12s.
Just published, a Pamphlet to the Uninitiated, with Instructions how to select a Microscope and test its Optical and Mechanical Qualities, for 7 Stamps. Catalogue fully Illustrated for 3 Stamps.

S. C. TISLEY & CO., 172, BROMPTON ROAD, LONDON, S.W.
TELEPHONIC ELECTRICITY. All Materials supplied for experimental purposes.
Price Lists of Electrical and Acoustic Apparatus, with Drawings and Description of the Harmonograph, Post Free, 2d.

MESSRS. MACMILLAN & CO.'S PUBLICATIONS.

Complete in Five Vols., price £6.

A SYSTEM OF MEDICINE.

Edited by J. RUSSELL REYNOLDS, M.D., F.R.S., &c.

Vol. I.—GENERAL DISEASES; or, AFFECTIONS of the WHOLE SYSTEM. 8vo. 25s.

Vol. II.—LOCAL DISEASES.—The NERVOUS SYSTEM.—The DIGESTIVE SYSTEM. 25s.

Vol. III.—LOCAL DISEASES.—The DIGESTIVE SYSTEM (continued)—The RESPIRATORY SYSTEM. 8vo. 25s.

Vol. IV.—LOCAL DISEASES.—DISEASES of the ORGANS of CIRCULATION.—The HEART. 21s.

Vol. V.—DISEASES of the ORGANS of CIRCULATION (continued) —The BLOOD-GLANDULAR SYSTEM. —URINARY ORGANS —FEMALE REPRODUCTIVE ORGANS. —CUTANEOUS SYSTEM.—GENERAL INDEX, &c. 25s.

Also now publishing in Twenty-four Monthly Parts, price 5s. each. Parts 1 to 18 now ready.

Just published, in 8vo, price 18s. Vol I.

COMPARATIVE EMBRYOLOGY: A TREATISE ON. By F. M. BALFOUR, M.A., F.R.S. With Illustrations. In 2 Vols.

Now ready, in 8vo, with Illustrations, price 18s., Vol. I.

A TEXT-BOOK OF THE PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY, INCLUDING AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE. By ARTHUR GAMGEE, M.D., F.R.S., Professor in the Victoria University, Manchester; Brackenbury Professor of Physiology in the Owens College. In 2 Vols.

"The arrangement and plan of the whole work are excellent, and the student has here for the first time a book in the English language which is available for the study as well as the laboratory."—*The Lancet.*

A TREATISE ON CHEMISTRY. Vols. I. and II.—INORGANIC CHEMISTRY. By Professors ROSCOE and SCHORLEMMER, of the Owens College, Manchester. With numerous Illustrations.

Vol. I.—THE NON-METALLIC ELEMENTS. 8vo. 21s. Vol. II.—METALS. Two Parts, 18s. each. [Vol. III.—ORGANIC CHEMISTRY *in the Press.*

"It would be difficult to praise it too highly——...The arrangement is clear and scientific, and the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid."—*The Lancet.*

COMPARATIVE ANATOMY: ELEMENTS OF. By Prof GEGENBAUR. A Translation by F. J. BELL, B.A., revised with Preface by Prof. E. RAY LANKESTER, F.R.S. With numerous Illustrations. 8vo. 21s.

"We do not hesitate to say that this is the best and most complete work on comparative anatomy in the language. . . . Any student who has made himself familiar with this work may consider that he possesses a sound elementary knowledge of animal morphology."—*The Lancet*

THE PRACTITIONER'S HANDBOOK OF TREATMENT; OR, THE PRINCIPLES OF THERAPEUTICS. By J. MILNER FOTHERGILL, M.D., Assistant-Physician to the Victoria Park Hospital. 8vo. 16s.

"A practical and suggestive work."—*The Lancet.* [*Second Edition, Revised and Enlarged, now ready.*

The ANTAGONISM of THERAPEUTIC AGENTS, AND WHAT THEY TEACH US. By J. M. FOTHERGILL, M.D. Crown 8vo. 6s.

DISEASES OF THE SKIN: The Treatment of. By Dr. M'CALL ANDERSON. Crown 8vo. 5s.

LECTURES ON CLINICAL MEDICINE. By Dr. M'CALL ANDERSON. Illustrated. 8vo. 10s. 6d.

ON ANEURISM, ESPECIALLY of the THORAX AND THE ROOT OF THE NECK. By R. BARWELL, F.R.C.S. Crown 8vo. 3s. 6d.

ON PARALYSIS FROM BRAIN DISEASE IN ITS COMMON FORMS. By H. CHARLTON BASTIAN, M.D., F.R.S. Illustrated. Crown 8vo. 10s. 6d.

DISEASES OF THE EYE. By R. BRUDENELL CARTER, F.R.C.S. With Illustrations. 8vo. 16s.

DEFECTS OF VISION WHICH ARE REMEDIABLE BY OPTIC APPLIANCES. By R. B. CARTER, F.R.C.S. Illustrated. 8vo. 6s.

EYESIGHT, GOOD AND BAD. By R. B. CARTER, F.R.C.S. Second Edition. Crown 8vo. 6s.

PHYSIOLOGY AND PATHOLOGY OF THE BREAST and its LYMPHATIC GLANDS. By C. CREIGHTON, M.D. With Illustrations. 8vo. 9s.

THE GERM THEORY APPLIED TO THE EXPLANATION OF THE PHENOMENA OF DISEASE. By T. MACLAGAN, M.D. 8vo. 10s. 6d.

THE PATHOLOGY OF MIND. By H. MAUDSLEY, M.D. New Edition, Revised and Enlarged. 8vo. 18s.

THE PHYSIOLOGY OF MIND. By H. MAUDSLEY, M.D. New Edition, Revised and Enlarged. Crown 8vo. 10s. 6d.

BODY AND MIND. By H. MAUDSLEY, M.D. New Edition, Enlarged. Crown 8vo 6s. 6d.

THE PRACTITIONER: A JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH. Edited by T. L. BRUNTON, M.D., F.R.S. Price 1s. 6d. monthly.

CONTENTS.—Original Communications, Reviews, Clinic of the Month, Extracts from the British and Foreign Journals, Notes and Queries, and Department of Public Health.

PHARMACOLOGY AND THERAPEUTICS; or, Medicine Past and Present. By T. LAUDER BRUNTON, M.D., F.R.S. Crown 8vo. 6s.

PHARMACOGRAPHIA: a History of the Principal Drugs of Vegetable Origin met with in Great Britain and India. By F. A. FLUCKIGER, M.D., and D. HANBURY, F.R.S. Second Edition, revised. 8vo. 21s.

TEXT-BOOK OF PHYSIOLOGY. By MICHAEL FOSTER, M.D., F.R.S. With Illustrations. New Edition. 8vo. 21s.

THE CARE OF THE INSANE, AND THEIR LEGAL CONTROL. By J. C. BUCKNILL, M.D., F.R.S. Crown 8vo. 3s. 6d.

WATER SUPPLY. By J. H. BALFOUR BROWNE. Crown 8vo. 2s. 6d.

ELEMENTARY BIOLOGY. By Prof. HUXLEY and H. N. MARTIN. Crown 8vo. 6s.

PHYSIOGRAPHY: an Introduction to the Study of NATURE. By Prof. HUXLEY, F.R.S. With Coloured Plates and Woodcuts. New and Cheaper Edition. Crown 8vo. 6s.

THE MORPHOLOGY OF THE SKULL. By Prof. PARKER, F.R.S., and G. T. BETTANY, B.Sc. Illustrated. Crown 8vo. 10s. 6d.

THE OSTEOLOGY OF THE MAMMALIA. A Series of Lectures by Prof. W. H. FLOWER, F.R.S., F.R.C.S. Illustrations. Crown 8vo. 10s. 6d.

PRACTICAL CHEMISTRY FOR MEDICAL STUDENTS, specially arranged for the First M.B. Course. By M. M. PATTISON MUIR, F.R.S.E. 18mo. 1s. 6d.

ELEMENTARY LESSONS IN ANATOMY. By ST. GEORGE MIVART, F.R.S. With 400 Illustrations. 18mo. 6s. 6d.

LESSONS IN ELEMENTARY PHYSIOLOGY. By Prof. HUXLEY. Illustrated. New Edition. 18mo. 4s. 6d.

LESSONS ON PRESCRIPTIONS AND THE ART OF PRESCRIBING. By W. H. GRIFFITHS, Ph.D., L.R.C.P.E. New Edition. 18mo. 3s. 6d.

MACMILLAN AND CO., Bedford Street, Strand, W.C.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo. £5 5s.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. By ALEXANDER GILCHRIST. A New and Enlarged Edition, Illustrated from BLAKE'S own Works, with Additional Letters and a Memoir of the Author. 2 vols. Medium 8vo. [*Immediately.*

ISLAND LIFE; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

A VISIT TO WAZAN, THE SACRED CITY of MOROCCO. By ROBERT SPENCE WATSON. 8vo, with Map and Illustrations. 10s 6d.

"Mr. Watson's account of his experiences in Morocco is much more pleasant than that of any other traveller's we know of . . . . and as a record of an independent and unprejudiced observer his little book, slight as it is, is of value."—*Times*

IDEAL CHEMISTRY. By Sir BENJAMIN BRODIE, Bart., F.R.S. Crown 8vo. 2s.

GOETHE'S FAUST. Translated into English Verse, with Notes and Preliminary Remarks, by JOHN STUART BLACKIE, F.R.S.E., Professor of Greek in the University of Edinburgh. Second Edition, carefully revised and largely rewritten. Crown 8vo. 9s.

ETIENNE DOLET: the Martyr of the Renaissance. A Biography, with a Bibliographical Appendix, containing a descriptive catalogue of the books written, edited, or printed by Dolet. By R. C CHRISTIE, M.A., Lincoln College, Oxford, Chancellor of the Diocese of Manchester. With Illustrations. 8vo. 18s.

"Mr. Christie's book may be cited as, in many respects, a model biography."—*Athenæum.*

"He draws portraits of persecutors from the life, worthy of the art of Rabelais and Bunyan"—*St. James's Gazette.*

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo. 6s.

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA. Professor of Political Economy in the University of Pavia Translated from the Second Italian Edition With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

THE IRISH LAND LAW. By ALEXANDER G. RICHEY, Q C, LL D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. [*Immediately.*

With Twenty-five Illustrations by WALTER CRANE.

THE NECKLACE OF PRINCESS FIORIMONDE: and other Stories. By MARY DE MORGAN. Extra fcap. 8vo 6s.

ALSO AN EDITION, Printed by Messrs R. and R. Clark, on hand-made paper The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d.

LOCKE. By Professor FOWLER. New Volume.

New Book by the Author of "The Tapestry Room," &c.

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS. MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo.

New Book by the Author of "When I was a Little Girl," &c.

PANSIE'S FLOUR BIN. By the Author of "St. Olave's," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

ESSAYS ON ART AND ARCHÆOLOGY. By C. T. NEWTON, C.B., LL D., Keeper of Greek and Roman Antiquities at the British Museum. 8vo. 12s. 6d.

"Mr. Newton deserves the gratitude of all Students of Archæology, for these masterly Essays. . . . . . are the fruit of a lifetime of exhaustive scholarship, and of such individual research as it seldom falls to the lot of any archæologist to accomplish."—*Westminster Review.*

MODERN GREECE: Two Lectures delivered before the Philosophical Institution of Edinburgh, with Papers on "The Progress of Greece," and "Byron in Greece." By R. C. JEBB, M.A., LL.D., Professor of Greek in the University of Glasgow. Crown 8vo 5s.

"Modern Greece needs but few words of recommendation to those interested in one of the most urgent and important questions of the day . . . . . We have to add an expression of our hope that the book, which is both scholarly and popular, will obtain all the success which it certainly deserves."—*Westminster Review.*

CICERO'S LIFE AND LETTERS. Being a Translation of the Letters in Mr. WATSON'S Selection, with Historical and Critical Notes, by the Rev. G. E. JEANS, M.A. 8vo. 10s 6d.

"The style . . . . is life-like, and shows literary power, nor is it superfluous to add that it is for the most part really English and idiomatic."—*Academy.*

"Mr. Jeans' translation deserves to take its place side by side with Davies and Vaughan's 'Republic,' and Church and Brodribb's 'Tacitus.'"—*St. James's Gazette.*

HISTORY OF THE ENGLISH PEOPLE. By JOHN RICHARD GREEN. Vol IV. THE REVOLUTION, 1683—1760. MODERN ENGLAND, 1760—1815 8vo, with 3 Maps and Index, 16s. (Vols. I. to III. 16s. each) [*Concluding Volume.*

"A work that most students of history may turn to with advantage, and that will be almost sure to take rank among the great classics of our literature"—*Globe.*

READINGS FROM ENGLISH HISTORY. Selected and Edited by JOHN RICHARD GREEN. In Three Parts, each 1s. 6d.

"We cannot imagine a better reading-book for the highest standard of our elementary schools, but it is a book which will have great charms also for the most cultivated readers."—*Guardian.*

PLINY'S LETTERS. Book III. Edited by Professor JOHN E B. MAYOR, M A. With Life of Pliny by G. H. RENDALL, M A. Fcap. 8vo. 5s [Macmillan's Classical Series.

XENOPHON'S ANABASIS. Books I.—IV. Edited by Professors W. W. GOODWIN and J. W. WHITE, of Harvard University. Fcap 8vo. 5s. [Macmillan's Classical Series.

LIVY.—SCENES FROM THE HANNIBALIAN WAR. Adapted for the use of Beginners by G. C. MACAULAY, M.A., Assistant-Master at Rugby. Post 8vo 1s 6d. [Macmillan's Elementary Classics.

MACMILLAN AND CO., LONDON.

STANDARD AND OBSERVATORY TIMEKEEPERS.

TRADE DENT MARK **MANUFACTURED BY E. DENT & CO.** TRADE DENT MARK

	Guineas.
Standard Clock, suitable for Private Residences in Town or Country, or Public Institutions, beating seconds and going eight days with once winding; in carved and decorated oak or mahogany case ... ... from	35
(*a*) The same, but going one month with once winding ... ... from	40
Standard Observatory Mean-time Clock	80
(*a*) The same, but furnished with electrical contact apparatus with eccentric screw adjustments for dropping a time ball, or transmitting hourly signals	92
Standard Observatory Sidereal Clock	80
(*a*) The same, but furnished with electrical contact apparatus with fine vertical and horizontal screw adjustments for transmitting seconds, currents for controlling other clocks, &c.	95
(*b*) The same, but arranged to omit the current at every 60th second, for pricking on chronograph barrel, &c.	97
Standard Observatory Clock, of the most refined construction, with barometric compensation, &c. ...	160
(*a*) The same, with Sir Geo. Airy's escapement ...	170
(*b*) The same, with M. Leverrier's electrical contact system	200

The New Standard Clock (the primary standard timekeeper of the United Kingdom) of the Royal Observatory, Greenwich, was constructed by E. Dent & Co., and precisely similar instruments are now being made for the Royal Observatories of Spain and Belgium. Standard Clocks of less refined construction for the Observatories of Edinburgh (Royal), Dunsink (Royal Irish), Oxford (University), Pulkowa (Russian Imperial), Geneva (National Swiss); and many others, Foreign and Colonial, have been manufactured.

Galvanic Chronographic Apparatus, for registering the time of occurrence of transits and other astronomical phenomena ... ... from	120

The Great Galvanic Chronograph of the Royal Observatory, Greenwich, and the still more powerful Apparatus for the Royal Observatory, Brussels, and other smaller ones for other Observatories were constructed by E. Dent & Co.

Also a Subscribed Capital of more than	£1,500,000

Reports, Prospectuses, and Forms may be had at the Office, or from any of the Company's Agents, post free.

GEORGE HUMPHREYS, Actuary and Secretary.

BROWNING'S LANTERNS.

THE NEW

THREE-WICK LANTERN.

PRICE

£4 7s. 6d.

New Illustrated Catalogue of Electric Lanterns, Magic Lanterns, Slides, and Diagrams, Sixpence.

Illustrated List of Instruments, for Presents or School Prizes, at Prices from 5s. to £10, sent free.

JOHN BROWNING,

63, STRAND, LONDON, W.C.

GEOLOGY.—In the Preface to the STU-DENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets :—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

TO MICROSCOPISTS.

LIVING DIATOMS.

Bacillaria paradoxa, Pleurosigma, and other Marine Diatoms. Tubes 9d. each. Three different for 2s. post free

W. SHRUBSOLE, Jun., Sheerness-on-Sea.

PARCELS of CHEAP FINE-ART PHOTOGRAPHS for Albums, Scrap-books, Framing, &c., sent by post for approval and selection. No obligation to purchase any, and no expense incurred beyond the postage Copies of celebrated Pictures, English and Foreign, Statuary, Views, Portraits of 600 Celebrities, Political, Literary, Poets, Musical Composers, &c. 600 different Subjects. Carte, Cabinet, and larger sizes from 1½d. each. Catalogue post free. Specimen Photograph, 3 Stamps.—Address R. SHEARER, Photographic Publisher, Wandsworth, London.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS of ORANGITE, ENSTATITE, BREVICITE, EUXENITE, AUGITE, PYROSMALITE.

UNIQUE SPECIMENS of ADULARIASPHENE and SMOKY QUARTZ.

FINE CRYSTALLISED CROMFORDITES and MATLOCKITE, Derbyshire.

XENOTINE CRYSTALLISED, Valais; WOLLASTONITE CRYSTALLISED.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s.* each; the succeeding vols. may be had separately or together, at 7*s.* each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh.

ISLAND LIFE:

OR, THE PHENOMENA OF INSULAR FAUNAS AND FLORAS, WITH THEIR CAUSES, INCLUDING AN ENTIRE REVISION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace has long devoted himself to these problems of geographical distribution; and his new volume gives us the cream of his latest thinking in a pleasant and eminently readable form. No other living naturalist has the same union of high literary excellence with profound scientific knowledge. His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The present volume, though in some respects intended as a popularisation of Mr. Wallace's previous works on the distribution of animals, yet contains an immense amount of new and important matter for the man of science, as well as much delightful reading for the less instructed public. It is, in fact, the final outcome of the author's most mature thought and research on the special subject which he has made most peculiarly his own. . . . The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

MACMILLAN AND CO., LONDON.

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21*s.*

Just ready. 8vo. 1*s.*

CORRECTIONS, NOTES, &c., TO THE HANDBOOK OF DOUBLE STARS.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy.*

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum.*

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic.*

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory.*

LIFE AND HER CHILDREN:

Glimpses of Animal Life from the Amœba to the Insects.

By ARABELLA B. BUCKLEY,

Authoress of "The Fairy-land of Science," "A Short History of Natural Science," "Botanical Tables for the Use of Junior Students."

EXTRACT FROM PREFACE.

"The main object is to acquaint young people with the structure and habits of the lower forms of life, and to do this in a more systematic way than is usual in ordinary works on natural history, and more simply than in text-books on zoology. For this reason I have adopted the title 'Life and Her Children' to express the family bond uniting all living things, as we use the term 'Nature and her Works' to embrace all organic and inorganic phenomena; and I have been more careful to sketch in bold outline the leading features of each division than to dwell upon the minor differences by which it is separated into groups. I have made use of British examples in illustration wherever it was possible, and small specimens of most of the marine animals figured may be found upon our coasts at low tide."

CONTENTS:

I. Life and her Children.
II. Life's Simplest Children: How they Live, and Move, and Build.
III. How Sponges Live.
IV. The Lasso-throwers of the Ponds and Oceans.
V. How Starfish Walk and Sea-Urchins Grow.
VI. The Mantle-covered Animals and How they Live with Heads and without them.
VII. The Outcasts of Animal Life: and the Elastic-ringed Animals by Sea and by Land.
VIII. The Mailed Warriors of the Sea, with ringed bodies and jointed feet.
IX. The Snare-Weavers and their Hunting Relations.
X. Insect Suckers and Biters, which change their coats but not their bodies.
XI. Insect Gnawers and Sippers, which remodel their bodies within their coats.
XII. Intelligent Insects with helpless Children, as illustrated by the Ants.

Uniform in size and price with

THE FAIRYLAND OF SCIENCE.

By the same Authoress.

London: EDWARD STANFORD, 55, Charing Cross, S.W.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S

PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success, is the most Reliable, most Effective, and Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which is safe in any storm.

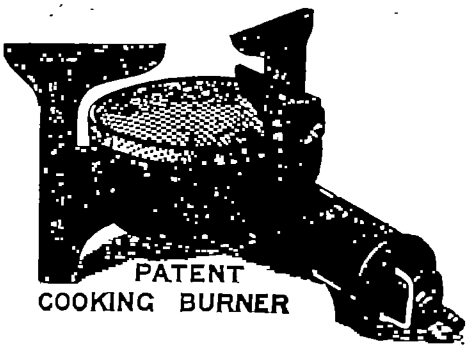
FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.

[PATENT, 3,203.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work. This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



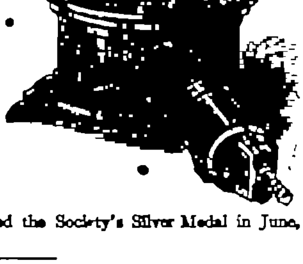
PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.

A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.

PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.

These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.



Complete Illustrated List, Price 2*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c.; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

THOS. FLETCHER,
4 & 6, *MUSEUM STREET, WARRINGTON.*

Scientific Series of Optical Lantern Slides.

THE series of Scientific Subjects which Mr. F. YORK has the honour of introducing to the notice of the public has been prepare to meet a long-felt want of a good and reliable series of photographic transparencies for illustrating Scientific Lectures. Th rapid extension of Science teaching under the South Kensington Science and Art Department, and the ever-growing demand fo popular Scientific Lectures, have long made a good series of illustrations a desideratum. The interest taken by the public in th Electric Light, and in such modern inventions as the Telephone and the Phonograph, has increased the call for well-illustrate Scientific Lectures; and for these there has existed, until the present time, no means of adequate illustration by the Magic Lantern.

The series now offered to the public, and to Scientific Lecturers in particular, comprises over Two Thousand Slides, and othe series are in active preparation. Those already completed are:—

ELECTRICITY AND MAGNETISM. SOUND. THE TELEPHONE, MICROPHONE, &c.
THE ELECTRIC LIGHT, AND OTHER RECENT INVENTIONS. LIGHT, INCLUDING SPECTRUM ANALYSIS. HUMAN PHYSIOLOGY.
ASTRONOMY. MINES AND MINERS. HEAT. MECHANICS, HYDROSTATICS, AND PNEUMATICS. NEW INVENTIONS.

A course of Slides illustrating Chemistry, and others in Geology, Physiography, and Biology, will shortly be announced. Particular care has been taken to include in the series such subjects as Science-teachers will find of use; pictures of large o expensive apparatus; the application of Science to the Arts; and pictures of important events in the history of Science, drawn fro the most reliable sources. By permission of the publishers, many of the best diagrams from the most important treatises, such a those of Tyndall, Ganot, and Roscoe, are included in the series, which will, on this account, possess a special value. No effor will be spared to make the series complete as new inventions and scientific discoveries occur.

In order to render these scientific subjects available during the dark evenings, in the schoolroom or the institute, where n scientific lecturer may be at hand, a series of popular Science Readings for the Lantern has been edited by Professor Silvanu Thompson, of University College, Bristol, which can be undertaken by any person accustomed to the now familiar style of Lantern Readings published by F. YORK. The following is a list of Science Readings for the Magic Lantern:—

ELECTRICITY AND MAGNETISM (in Three Parts). THE TELEPHONE, MICROPHONE, AND PHONOGRAPH.
THE ELECTRIC LIGHT, AND OTHER RECENT INVENTIONS. WAVES OF SOUND. HUMAN PHYSIOLOGY.

In Preparation.

RAYS OF LIGHT. MARVELS OF THE SKY.
SPECTRUM ANALYSIS, AND WHAT IT TELLS US ABOUT THE SUN AND STARS. HEAT AND COLD. FROST, ICE, AND SNOW.

The size is the usual English gauge 3¼ inches square, and the price 18*s*. per dozen. A Sample and Catalogue sent on receipt of 2*s*.

FRY'S COCOA EXTRACT

GOLD MEDAL,
PARIS EXHIBITION.

In Packets and Tins. Pure Cocoa only, with the superfluous oil extracted.

"If properly prepared, there is no nicer or more wholesome preparation of cocoa."—*Food, Water, and Air, edited by Dr. Hassall.*

J. S. FRY & SONS, Bristol and London.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo. £5 5*s*.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. By ALEXANDER GILCHRIST A New and Enlarged Edition, Illustrated from BLAKE'S own Works, with Additional Letters and a Memoir of the Author 2 vols. Medium 8vo. [*Immediately.*

ISLAND LIFE; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18*s*

"The work throughout abounds with interest."—*Athenæum.*

"'Island Life' is a work to be accepted without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

A VISIT TO WAZAN, THE SACRED CITY of MOROCCO. By ROBERT SPENCE WATSON. 8vo, with Map and Illustrations. 10*s* 6*d*.

"Mr. Watson's account of his experiences in Morocco is much more pleasant than that of any other traveller's we know of . . . . and as a record of an independent and unprejudiced observer his little book, slight as it is, is of value."—*Times.*

IDEAL CHEMISTRY. By Sir BENJAMIN BRODIE, Bart., F.R.S. Crown 8vo. 2*s*.

GOETHE'S FAUST. Translated into English Verse, with Notes and Preliminary Remarks, by JOHN STUART BLACKIE, F.R.S.E., Professor of Greek in the University of Edinburgh. Second Edition, carefully revised and largely rewritten. Crown 8vo 9*s*.

ETIENNE DOLET: the Martyr of the Renaissance. A Biography, with a Bibliographical Appendix, containing a descriptive catalogue of the books written, edited, or printed by Dolet By R. C CHRISTIE, M A., Lincoln College, Oxford, Chancellor of the Diocese of Manchester. With Illustrations 8vo. 18*s*.

"Mr Christie's book may be cited as, in many respects, a model biography."—*Athenæum.*

"He draws portraits of persecutors from the life, worthy of the art of Rabelais and Bunyan."—*St. James's Gazette.*

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo. 6*s*.

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA. Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4*s*. 6*d*.

THE IRISH LAND LAW. By ALEXANDER G. RICHEY, Q C., LL D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. [*Immediately.*

With Twenty-five Illustrations by WALTER CRANE.

THE NECKLACE OF PRINCESS FIORIMONDE: and other Stories By MARY DE MORGAN. Extra fcap. 8vo. 6*s*.

ALSO AN EDITION, Printed by Messrs. R. and R Clark, on hand-made paper. The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2*s*. 6*d*.

LOCKE. By Professor FOWLER. New Volume.

New Book by the Author of "The Tapestry Room," &c.

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4*s* 6*d*.

New Book by the Author of "When I was a Little Girl," &c.

PANSIE'S FLOUR BIN. By the Author of "St. Olave's," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4*s*. 6*d*.

ESSAYS ON ART AND ARCHÆOLOGY. By C. T. NEWTON, C.B., LL D, Keeper of Greek and Roman Antiquities at the British Museum. 8vo. 12*s*. 6*d*.

"Mr. Newton deserves the gratitude of all Students of Archæology, for these masterly Essays. . . . . . are the fruit of a lifetime of exhaustive scholarship, and of such individual research as it seldom falls to the lot of any archæologist to accomplish."—*Westminster Review.*

MODERN GREECE: Two Lectures delivered before the Philosophical Institution of Edinburgh, with Papers on "The Progress of Greece," and "Byron in Greece." By R. C. JEBB, M A., LL D., Professor of Greek in the University of Glasgow. Crown 8vo. 5*s*.

"Modern Greece needs but few words of recommendation to those interested in one of the most urgent and important questions of the day . . . . We have to add an expression of our hope that the book, which is both scholarly and popular, will obtain all the success which it certainly deserves."—*Westminster Review.*

CICERO'S LIFE AND LETTERS. Being a Translation of the Letters in Mr. WATSON'S Selection, with Historical and Critical Notes, by the Rev. G. E. JEANS, M.A. 8vo. 10*s* 6*d*.

"The style . . . . is life-like, and shows literary power, nor is it superfluous to add that it is for the most part really English and idiomatic."—*Academy*

"Mr. Jeans' translation deserves to take its place side by side with Davies and Vaughan's 'Republic,' and Church and Brodribb's 'Tacitus.'"—*St. James's Gazette.*

HISTORY OF THE ENGLISH PEOPLE. By JOHN RICHARD GREEN. Vol IV. THE REVOLUTION, 1683—1760. MODERN ENGLAND, 1760—1815. 8vo, with 3 Maps and Index, 16*s*. (Vols. I. to III. 16*s*. each.) [*Concluding Volume.*

"A work that most students of history may turn to with advantage, and that will be almost sure to take rank among the great classics of our literature."—*Globe.*

READINGS FROM ENGLISH HISTORY. Selected and Edited by JOHN RICHARD GREEN. In Three Parts, each 1*s*. 6*d*.

"We cannot imagine a better reading-book for the highest standard of our elementary schools, but it is a book which will have great charms also for the most cultivated readers."—*Guardian.*

XENOPHON'S ANABASIS. Books I.—IV. Edited by Professors W. W. GOODWIN and J. W. WHITE, of Harvard University. Fcap 8vo. 5*s*. [Macmillan's Classical Series.

LIVY.—SCENES FROM THE HANNIBALIAN WAR. Adapted for the use of Beginners by G. C. MACAULAY, M.A., Assistant-Master at Rugby. Post 8vo. 1*s* 6*d*. [Macmillan's Elementary Classics.

THE STORY OF ACHILLES, FROM HOMER'S ILIAD. Edited, with Notes and Introduction, by J. H. PRATT, M.A., Fellow of Trinity College, Cambridge, Assistant-Master at Harrow; and WALTER LEAF, M.A., Fellow of Trinity College, Cambridge. Fcap. 8vo. 6*s*. [Macmillan's Classical Series.

MACMILLAN AND CO., LONDON.

Cassell, Petter, Galpin & Co.'s Announcements.

SIR GAVAN DUFFY'S NEW BOOK.

YOUNG IRELAND. By THE HON. SIR CHARLES GAVAN DUFFY. Price 21*s.*

NOTICE.—The FIRST LARGE EDITION of this book having been exhausted on the day of publication, a SECOND EDITION is being rapidly prepared, and will be ready in a few days.

"Whatever may be the shortcomings of Sir Charles Gavan Duffy's book, and we frankly concede we have not found any, it has, at all events, the advantage of being written by one who knows more about the subject of which he treats than any living man. . . . We can heartily commend Sir Charles Gavan Duffy's book to our readers as combining the narration of weighty and important historical facts with the pleasing touches and happily distracting incidents of a charming tale."—*Morning Post.*

Now ready, Vols. I. and II. Price 7*s.* 6*d.* each.

OUR OWN COUNTRY. Each containing about 200 Original Illustrations and Steel Frontispiece.

The *Times* of October 21, 1880, says:—"The beautiful work which Messrs. Cassell and Co. are publishing under the above title appeals to a very wide circle of readers. The treatment is full and comprehensive, embracing architecture, scenery, history, and antiquities, industry and art, physical geography, and natural history. The work is creditable to author, draughtsman, and engraver."

Complete in five magnificent volumes, royal 4to, cloth, 2*l.* 2*s.* each; half morocco, 3*l.* 3*s.* each; or in morocco, 5*l.* 5*s.* each.

PICTURESQUE EUROPE. With 65 exquisite Steel Plates from Original Drawings and nearly 1000 Original Illustrations by the best Artists. With Descriptive Letterpress.

"Nothing on so grand a scale has been planned before, nor anything, so far as we know, so well executed. . . . The more we study the five superb volumes in which Messrs. Cassell, Petter, Galpin, and Co. have collected a rich and varied series of pen and pencil illustrations of the picturesque scenery and buildings of Europe, the more are we impressed with the high quality of the literary as well as the artistic contents of the whole work—a single volume, indeed, of the set constitutes a charming and valuable gift."—*Spectator.*

JUST PUBLISHED, price 9s.

SCIENCE FOR ALL YEARLY VOLUME FOR 1880. Edited by **Dr. Robert Brown, M.A., F.L.S.** Assisted by Eminent Scientific Writers. With about **350 Illustrations** and **Diagrams.**

The Athenæum of October 30, 1880, says:—

"Whatever branch of science a man may happen to be studying, he is sure to find something to his taste in turning over the pages of this work. Not to go beyond the volume which has just been issued, the astronomer will find articles on Mars, on Jupiter, and on comets; the meteorologist will learn something about clouds and dew, snow and hail, thunder and lightning; the physicist may carry on his studies in electricity and in sound; the zoologist will feel at home with corals and starfishes, butterflies and cockroaches, cuttlefishes, snails, and frogs; the botanist at one time listens to the lessons taught by plants during flowering, and at another time learns the origin of the potato disease; the mineralogist may revel among emeralds and beryls, or may descend the depths of a lead-mine; the geologist will find descriptions of extinct volcanoes; while the physical geographer turns his attention to coral islands, to rivers, and to table-lands, or, finally, diving to the sea-bottom, learns the mysteries of deep-sea life. Surely there is here sufficient diversity to please everybody who has a scientific hobby. After looking through the work we are disposed to think that, on the whole, each volume is an advance upon its predecessors, both in the character of the articles and in the excellence of the illustrations."

Now Ready, Vols. I. to IV., price 9*s.* each.

CASSELL'S NEW NATURAL HISTORY. Edited by P. MARTIN DUNCAN M.B., F.R.S., Professor of Geology, King's College, London. Illustrated throughout.

Vol. IV., now ready, contains:—

BIRDS. By R. BOWDLER SHARPE, F.L.S.
REPTILES (Tortoises, Crocodiles, Lizards, and Snakes). By Prof. P. MARTIN DUNCAN, F.R.S.
AMPHIBIANS. By Prof. P. MARTIN DUNCAN, F.R.S.

Now Ready, Vols. I. to V., price 7*s.* 6*d.* each.

THE COUNTRIES OF THE WORLD. By ROBERT BROWN, M.A., Ph.D., F.L.S., F.R.G.S. Each volume contains about 130 Illustrations.

"'The Countries of the World' shows considerable powers of graphic description, and contains a vast amount of really trustworthy geographical information. The book is profusely illustrated, most of the illustrations being appropriate and helpful."—*The Times.*

CASSELL, PETTER, GALPIN, AND CO., Ludgate Hill, London.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, November 11, 1880.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

> *"To the solid ground*
> *Of Nature trusts the mind which builds for aye."*—WORDSWORTH

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price One Shilling.

LIGHTNING CONDUCTORS:

THEIR HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.
With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy*.

London: E. & F. N. SPON, 46, Charing Cross.

ISLAND LIFE:

OR, THE PHENOMENA OF INSULAR FAUNAS AND FLORAS, WITH THEIR CAUSES, INCLUDING AN ENTIRE REVISION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace has long devoted himself to these problems of geographical distribution; and his new volume gives us the cream of his latest thinking in a pleasant and eminently readable form. No other living naturalist has the same union of high literary excellence with profound scientific knowledge. His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The present volume, though in some respects intended as a popularisation of Mr. Wallace's previous works on the distribution of animals, yet contains an immense amount of new and important matter for the man of science, as well as much delightful reading for the less instructed public. It is, in fact, the final outcome of the author's most mature thought and research on the special subject which he has made most peculiarly his own. . . . The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

Next Week.

PRE-HISTORIC EUROPE:
A Geological Sketch.
By JAMES GEIKIE, LL.D., F.R.S., &c.
Of H.M. Geological Survey of Scotland, Author of "The Great Ice Age."
Medium 8vo, with Maps and Illustrations.

"The object of these pages is to give an outline of what appear to have been the most considerable physical changes experienced in our continent since the beginning of the Pleistocene or Quaternary period. Several general works, by some of our most accomplished geologists and archæologists, have already dealt with the subject in part, but none quite cover the ground I have endeavoured to occupy. While some of my predecessors have examined the evidence principally from the point of view of the archæologist, and others from that of the palæontologist, my aim has been to describe in a more systematic manner than has hitherto been attempted that succession of changes, climatic and geographical, which, taken together, constitute the historical geology of Pleistocene, Post-glacial, and recent times."—*Extract from Preface.*

In a few days,

THE COAL-FIELDS OF GREAT BRITAIN;
Their History, Structure, and Resources.
With Notices of the Coal-Fields of other Parts of the World.
By EDWARD HULL, M.A., F.R.S.,
Director of the Geological Survey of Ireland, Author of "The Physical Geology and Geography of Ireland."
Fourth Edition, demy 8vo, with Maps and Illustrations.

"This edition has been largely re-written. It contains an entirely new chapter on Carboniferous Plants, kindly drawn up by Prof Williamson, F.R.S., of Manchester. The classification of the Carboniferous Series of Beds has been modified in accordance with the views enunciated in my paper on this subject, read before the Geological Society of London in 1877. The account of the various coal-fields has been modified in accordance with more recent investigations as far as my information extends, and the statistical portions have been brought down to the date of 1878."—*Extract from Preface.*

Ready,

LIFE AND HER CHILDREN:
Glimpses of Animal Life from the Amœba to the Insects.
By ARABELLA B. BUCKLEY,
Authoress of "The Fairy-land of Science," "A Short History of Natural Science," "Botanical Tables for the Use of Junior Students."
Crown 8vo, with upwards of 100 Illustrations, Cloth Gilt, Gilt Edges. 6s.

EXTRACT FROM PREFACE.

"The main object is to acquaint young people with the structure and habits of the lower forms of life; and to do this in a more systematic way than is usual in ordinary works on natural history, and more simply than in text-books on zoology. For this reason I have adopted the title 'Life and Her Children' to express the family bond uniting all living things, as we use the term 'Nature and her Works' to embrace all organic and inorganic phenomena; and I have been more careful to sketch in bold outline the leading features of each division than to dwell upon the minor differences by which it is separated into groups. I have made use of British examples in illustration wherever it was possible, and small specimens of most of the marine animals figured may be found upon our coasts at low-tide."

Chapter CONTENTS:
I. Life and her Children.
II. Life's Simplest Children: How they Live, and Move, and Build.
III. How Sponges Live.
IV. The Lasso-throwers of the Ponds and Oceans.
V. How Starfish Walk and Sea-Urchins Grow.
VI. The Mantle-covered Animals and How they Live with Heads and without them.
VII. The Outcasts of Animal Life: and the Elastic-ringed Animals by Sea and by Land.
VIII. The Mailed Warriors of the Sea, with ringed bodies and jointed feet.
IX. The Snare-Weavers and their Hunting Relations.
X. Insect Suckers and Biters, which change their coats but not their bodies.
XI. Insect Gnawers and Sippers, which remodel their bodies within their coats.
XII. Intelligent Insects with helpless Children, as illustrated by the Ants.

By the same Authoress, uniform in size and price,

THE FAIRYLAND OF SCIENCE.

Nearly ready,

HOUSEHOLD SCIENCE:
Readings in Necessary Knowledge for Girls and Young Women.
Edited by REV. J. P. FAUNTHORPE, M.A.,
Principal of Whitelands College.
Dedicated by permission to His Grace the Duke of Westminster, K.G.
Post 8vo.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been issued.

LOCKE. By Prof. FOWLER.

"In the case of Locke's biographer we venture to say that Mr Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain"—*Examiner*.

BYRON. By Prof NICHOL.

"Decidedly one of the most careful and valuable of the whole series. When a book is so good as Prof. Nichol's, there is little to be said about it except to recommend it as widely as may be."—*Athenæum*.

POPE. By LESLIE STEPHEN.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken"—*St. James's Gazette*.

COWPER. By GOLDWIN SMITH.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News*.

CHAUCER. By Prof. A. W. WARD.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy*.

BUNYAN. By J. A. FROUDE.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum*.

SOUTHEY. By Prof. DOWDEN.

"A truly scholarly and delightful monograph."—*Examiner*.

HAWTHORNE. By HENRY JAMES, JUN.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation*.

MILTON. By MARK PATTISON.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator*.

JOHNSON. By LESLIE STEPHEN.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette*.

SCOTT. By R. H. HUTTON.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner*.

GIBBON. By J. C. MORISON.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner*.

SHELLEY. By J. A. SYMONDS.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum*.

HUME. By Prof. HUXLEY, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum*.

GOLDSMITH. By WILLIAM BLACK.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum*.

DEFOE. By W. MINTO.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum*.

BURNS. By Principal SHAIRP.

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry. . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator*.

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy*.

THACKERAY. By ANTHONY TROLLOPE.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum*.

BURKE. By JOHN MORLEY.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review*.

G. RICHEY, Q C., LL D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d. [*Immediately.*

With Twenty-five Illustrations by WALTER CRANE.

THE NECKLACE OF PRINCESS FIORI-

MONDE. and other Stories. By MARY DE MORGAN. Extra fcap. 8vo. 6s.

ALSO AN EDITION, Printed by Messrs R. and R. Clark, on handmade paper. The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book"—*Graphic.*

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

ENGLISH MEN OF LETTERS. Edited

by JOHN MORLEY. Crown 8vo 2s. 6d.

LOCKE. By Professor FOWLER. New Volume.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Professor Fowler's for this particular work might have been sought, and sought in vain"—*Examiner.*

A CHRISTMAS CHILD: a Sketch of a

Boy-life. By MRS MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s 6d

PANSIE'S FLOUR BIN. By the Author

of "When I was a Little Girl," &c Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post*

ESSAYS ON ART AND ARCHÆOLOGY.

By C. T. NEWTON, C.B, LL D, Keeper of Greek and Roman Antiquities at the British Museum 8vo. 12s. 6d

"Mr. Newton deserves the gratitude of all Students of Archæology, for these masterly Essays. . . . . . are the fruit of a lifetime of exhaustive scholarship, and of such individual research as it seldom falls to the lot of any archæologist to accomplish."—*Westminster Review.*

MODERN GREECE: Two Lectures delivered

before the Philosophical Institution of Edinburgh, with Papers on "The Progress of Greece," and "Byron in Greece." By R C. JEBB, M A., LL.D., Professor of Greek in the University of Glasgow. Crown 8vo 5s

"Modern Greece needs but few words of recommendation to those interested in one of the most urgent and important questions of the day . . . We have to add an expression of our hope that the book, which is both scholarly and popular, will obtain all the success which it certainly deserves."—*Westminster Review.*

CICERO'S LIFE AND LETTERS. Being

a Translation of the Letters in Mr WATSON'S Selection, with Historical and Critical Notes, by the Rev. G. E. JEANS, M.A. 8vo. 10s. 6d.

"The style . . . is life-like, and shows literary power, nor is it superfluous to add that it is for the most part really English and idiomatic"—*Academy.*

"Mr. Jeans' translation deserves to take its place side by side with Davies and Vaughan's 'Republic,' and Church and Brodribb's 'Tacitus.'"—*St James's Gazette.*

HISTORY OF THE ENGLISH PEOPLE.

By JOHN RICHARD GREEN. Vol IV THE REVOLUTION, 1683—1760. MODERN ENGLAND, 1760—1815 8vo, with 3 Maps and Index, 16s. (Vols. I. to III 16s. each) [*Concluding Volume.*

"A work that most students of history may turn to with advantage, and that will be almost sure to take rank among the great classics of our literature."—*Globe.*

READINGS FROM ENGLISH HISTORY.

Selected and Edited by JOHN RICHARD GREEN. In Three Parts, each 1s 6d.

"We cannot imagine a better reading-book for the highest standard of our elementary schools, but it is a book which will have great charms also for the most cultivated readers."—*Guardian.*

XENOPHON'S ANABASIS. Books I.—IV.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

GEOLOGY.

COLLECTIONS FOR TEACHERS AND STUDENTS.

Gold Medal awarded for superiority of these Collections.

New Lists of Prices of Collections, Cabinets, Apparatus, Rock Sections and all Necessaries, of

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Next week,

THE COAL-FIELDS OF GREAT BRITAIN:

Their History, Structure, and Resources.

With Descriptions of the Coal-Fields of our Indian and Colonial Empire, and of other Parts of the World.

By EDWARD HULL, M.A., F.S.A.,
Director of the Geological Survey of Ireland; Author of "The Physical Geology and Geography of Ireland."

Fourth Edition, Revised, Embodying the Reports of the Royal Coal Commission, demy 8vo, with Maps and Illustrations.

"This edition has been largely re-written. It contains an entirely new chapter on Carboniferous Plants, kindly drawn up by Prof. Williamson, F.R.S., of Manchester. The classification of the Carboniferous Series of Beds has been modified in accordance with the views enunciated in my paper, on this subject, read before the Geological Society of London in 1877. The account of the various coal-fields has been modified in accordance with more recent investigations as far as my information extends, and the statistical portions have been brought down to the date of 1878."—*Extract from Preface.*

London: EDWARD STANFORD, 55, Charing Cross, S.W.

This day,

PRE-HISTORIC EUROPE:

A Geological Sketch.

By JAMES GEIKIE, LL.D., F.R.S., &c.,
Of Her Majesty's Geological Survey of Scotland; Author of "The Great Ice Age."

Medium 8vo, with Maps and Illustrations. Cloth, 25s.

"The object of these pages is to give an outline of what appear to have been the most considerable physical changes experienced in our continent since the beginning of the Pleistocene or Quaternary period. Several general works, by some of our most accomplished geologists and archæologists, have already dealt with the subject in part, but none quite cover the ground I have endeavoured to occupy. While some of my predecessors have examined the evidence principally from the point of view of the archæologist, and others from that of the palæontologist, my aim has been to describe in a more systematic manner than has hitherto been attempted that succession of changes, climatic and geographical, which, taken together, constitute the historical geology of Pleistocene, Post-glacial, and recent times."—*Extract from Preface.*

London: EDWARD STANFORD, 55, Charing Cross, S.W.

Ready,

THE FLORA OF ALGERIA,

Considered in Relation to the Physical History of the Mediterranean Region, and Supposed Submergence of the Sahara.

By W. MATHEWS, M.A.

Demy 8vo, with Coloured Map, cloth, 2s. 6d.

London: EDWARD STANFORD, 55, Charing Cross, S.W.

EDITED BY HENRY WATTS, B.A., F.R.S.,
Editor of the *Journal* of the Chemical Society

FOWNES' PHYSICAL and INORGANIC CHEMISTRY. Twelfth Edition, with Coloured Plate and 154 Engravings, crown 8vo. 8s. 6d.

Also,

FOWNES' CHEMISTRY OF CARBON COMPOUNDS; or, ORGANIC CHEMISTRY. Twelfth Edition, with Engravings, crown 8vo. 10s.

With 112 Engravings and 5 Maps of the Stars.
POPULAR ASTRONOMY.
BY
PROFESSOR S. NEWCOMB, LL.D.
8vo, cloth, price 18*s.*

"As affording a thoroughly reliable foundation for more advanced reading, Prof. Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

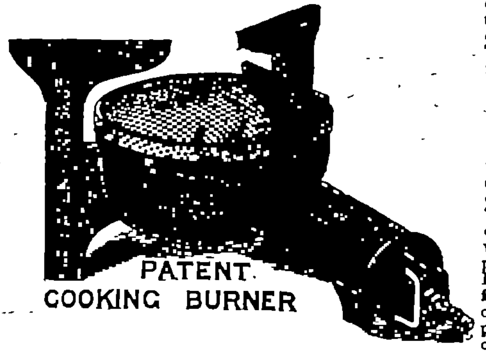
Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints

---

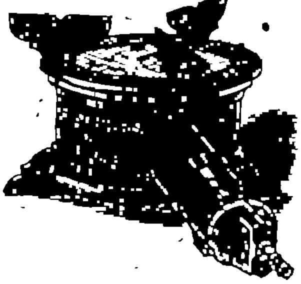
FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.
[PATENT, 3,203.]
The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work. This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.
A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.
PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.
These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.

Complete Illustrated List, Price 3*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c.; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.



THOS. FLETCHER,
4 & 6, *MUSEUM STREET, WARRINGTON.*

Extra fcap. 8vo, 3*s.* 6*d.*
METALS and their CHIEF INDUSTRIAL APPLICATIONS. By C. ALDER WRIGHT, D.Sc., Lecturer on Chemistry in St. Mary's Hospital Medical School. With Illustrations.
MACMILLAN & CO., LONDON.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

The Edition is limited to 1000 copies, nearly all of which have been subscribed for. The price is now raised to £7 7s

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. By ALEXANDER GILCHRIST. A New and Enlarged Edition, Illustrated from BLAKE'S own Works, with Additional Letters and a Memoir of the Author Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. 2 vols., cloth gilt, elegant, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. £2 2s

Several new Illustrations have been added to this work; among others the following may be named:—The Phillips Portrait of Blake; two new Portraits by Blake of his Wife; a new plate from the *Jerusalem*; a newly-discovered design to *Hamlet*; and a drawing of *Blake's Cottage at Felpham*. New Photogravures of the *Inventions to the Book of Job* are given Some thirty additional letters are included in the Biographical portion of the work, forming a new link in the already interesting life of Blake. And Mr. W. M. Rossetti has revised, enlarged, and perfected the annotated catalogue of Blake's works that appeared in the first edition of the work.
[*Immediately.*

ISLAND LIFE; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest"—*Athenæum.*

"Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"We have said enough to show that Mr Wallace is led to discuss subjects of great interest to speculative minds."—*Pall Mall Gazette.*

A VISIT TO WAZAN, THE SACRED CITY of MOROCCO. By ROBERT SPENCE WATSON. 8vo, with Map and Illustrations. 10s. 6d.

"The result is one of the most delightful narratives we have had the good fortune to meet with for a very long time . . . In conclusion it remains to be said that Mr. Watson writes in a vigorous, scholarly style, manly and unaffected, oftentimes picturesque, but never descending to mere word-painting."—*Examiner.*

A DICTIONARY OF MUSIC AND MUSICIANS (A D. 1450—1878). By Eminent Artists, English and Foreign. With Illustrations and Woodcuts. Edited by GEORGE GROVE, D.C.L. In three Volumes. Vols I. and II. cloth. 21s. each.

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song.

IDEAL CHEMISTRY. By Sir BENJAMIN BRODIE, Bart., F.R.S Crown 8vo. 2s.

FOOD FOR THE INVALID, THE CONVALESCENT, THE DYSPEPTIC, AND THE GOUTY. By J. MILNER FOTHERGILL, M.D., Author of "The Practitioner's Handbook," &c. Crown 8vo. 3s. 6d.

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo. 6s

"Besides these answers to questions which greatly increase the value of the book, and make it almost an independent manual of the subject, Professor Jevons has taken occasion to supplement his previous works in various directions. It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

THE IRISH LAND LAW. By ALEXANDER G. RICHEY, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s 6d.

THE ARYAN VILLAGE. Modern Village Life in Bengal.—The Agricultural Community in Ceylon.—Supposed Rise and Growth of the Indo-Aryan Village System and Social Grades. By Sir JOHN PHEAR. Crown 8vo. 7s. 6d.

With Twenty-five Illustrations by WALTER CRANE.

THE NECKLACE OF PRINCESS FIORIMONDE: and other Stories. By MARY DE MORGAN. Extra fcap. 8vo. 6s.

ALSO AN EDITION, Printed by Messrs R. and R. Clark, on hand-made paper. The Plates, initial letters, head- and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book."—*Graphic.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d. (New Volumes)

WORDSWORTH. By F. W. MYERS. [*On December* 12.

LOCKE. By Professor FOWLER.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Professor Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS. MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s 6d.

PANSIE'S FLOUR BIN. By the Author of "When I was a Little Girl," &c Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post.*

CICERO'S LIFE AND LETTERS. Being a Translation of the Letters in Mr. WATSON'S Selection, with Historical and Critical Notes, by the Rev. G. E. JEANS, M.A. 8vo. 10s. 6d.

"The style . . . is life-like, and shows literary power, nor is it superfluous to add that it is for the most part really English and idiomatic."—*Academy.*

HISTORY OF THE ENGLISH PEOPLE. By JOHN RICHARD GREEN. Vol. IV. THE REVOLUTION, 1683—1760. MODERN ENGLAND, 1760—1815. 8vo, with 3 Maps and Index, 16s. (Vols. I. to III. 16s. each) [*Concluding Volume.*

"A work that most students of history may turn to with advantage, and that will be almost sure to take rank among the great classics of our literature."—*Globe.*

READINGS FROM ENGLISH HISTORY. Selected and Edited by JOHN RICHARD GREEN In Three Parts, each 1s. 6d.

"We cannot imagine a better reading-book for the highest standard of our elementary schools, but it is a book which will have great charms also for the most cultivated readers."—*Guardian.*

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

⁂ Upwards of 150,000 Vols. of this series have been issued

LOCKE. By Prof. FOWLER.

"In the case of Locke's biographer we venture to say that Mr Morley has been exceptionally fortunate. A pen more competent than Prof Fowler's for this particular work might have been sought, and sought in vain."—*Examiner*.

BYRON. By Prof NICHOL.

"Decidedly one of the most careful and valuable of the whole series When a book is so good as Prof. Nichol's, there is little to be said about it except to recommend it as widely as may be."—*Athenæum*.

POPE. By LESLIE STEPHEN.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette*.

COWPER. By GOLDWIN SMITH.

"Mr Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News*.

CHAUCER. By Prof. A. W. WARD.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy*.

BUNYAN. By J. A. FROUDE.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum*.

SOUTHEY. By Prof. DOWDEN.

"A truly scholarly and delightful monograph."—*Examiner*.

HAWTHORNE. By HENRY JAMES, JUN.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation*.

MILTON. By MARK PATTISON.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator*.

JOHNSON. By LESLIE STEPHEN.

"The new series opens well with Mr Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette*.

SCOTT. By R. H. HUTTON.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner*.

GIBBON. By J. C. MORISON.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner*.

SHELLEY. By J. A. SYMONDS.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum*.

HUME. By Prof. HUXLEY, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum*.

GOLDSMITH. By WILLIAM BLACK.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum*.

DEFOE. By W. MINTO.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum*.

BURNS. By Principal SHAIRP.

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry. . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator*.

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy*.

THACKERAY. By ANTHONY TROLLOPE.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum*.

BURKE. By JOHN MORLEY.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review*.

Others in Preparation.

MACMILLAN AND CO., LONDON.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, November 25, 1880.

NATURE

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48B, Tollington Road, Holloway, London, N.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS of ORANGITE, ENSTATITE, BREVICITE, EUXENITE, AUGITE, PYROSMALITE.

UNIQUE SPECIMENS of ADULARIASPHENE and SMOKY QUARTZ.

FINE CRYSTALLISED CROMFORDITES and MATLOCKITE, Derbyshire.

XENOTINE CRYSTALLISED, Valais; WOLLASTONITE CRYSTALLISED.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113a), STRAND, LONDON, W.C.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra; Ground edged Slips, 5s. per gross; also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

R. FRIEDLÄNDER & SOHN,

BERLIN N.W., CARLSTRASSE 11.

NATURAL HISTORY & NATURAL SCIENCE BOOKSELLERS,

Established since 1827.

Largest Stock of the whole Literature of Natural History and the Exact Sciences.

Apply for Classified Catalogue in 25 Parts (each one Special Department of Science), price 6d. each.

Just published: Part IX., Entomology, 1: Scripta Miscellanea, Coleoptera, 40 pgs.—Part X., Entomology, 2: Lepidoptera, 22 pgs.—Part XI., Entomology, 3: Hymenoptera, Neuroptera, Orthoptera, Diptera, Hemiptera, Parasita, 30 pgs. These Catalogues comprise the Entomological Library of Prof. C. Stal of Stockholm.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

Abonnement franco par la poste—un an, 15*s*. 2*d*.; six mois, 7*s*. 7*d*. Prix 3*d*., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic*.

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen*.

BLOWPIPE ANALYSIS:

By J. LANDAUER.

Extra Foolscap 8vo, price 4*s*. 6*d*.

Authorised English Edition by JAMES TAYLOR and WILLIAM E. KAY, of the Owens College, Manchester.

The present English Translation contains the Author's latest Corrections and Additions, and has been printed under his personal supervision. Amongst the additions will be found the Author's Systematic Course of Analysis, an extended description of Bunsen's Flame Reactions, and the Reactions with Aluminum Plate proposed by Ross as a substitute for Charcoal.

CONTENTS.

Preface.
Examples for Practice.
Apparatus and Reagents.
The Operations of Blowpipe Analysis.
Bunsen's Flame Reactions.
Special Examination for Certain Elements in Combination.
Systematic Examination of Compound Inorganic Substances.
Condensed View of the Blowpipe Reactions.
Tabular View of the Behaviour of the Earth, Alkalis, and Metallic Oxides, alone and with Reagents, before the Blowpipe.
Index.

9. Small-hand Single Head Lines. Figures.
10. Small-hand Single Head Lines. Figures.
11. Small-hand Double Head Lines.
12. Commercial and Arithmetical Examples, &c.

12a. Practising and Revising Copy-Books for Nos. 8 to 12.

Nos. 1 to 9, and 11, may be had with Goodman's Patent Sliding Copies. Large post 4to, price 6*d*. each.

By a simple device the copies, which are printed upon separate slips, are arranged with a movable attachment, by which they are adjusted so as to be directly before the eye of the pupil at all points of his progress. It enables him also to keep his own faults concealed, with perfect models constantly in view for imitation. Every experienced teacher knows the advantage of the slip copy, but its practical application has never before been successfully accomplished. This feature is secured exclusively to Macmillan's Copy-books under Goodman's patent.

An inspection of books written on the old plan, with copies at the head of the page, will show that the lines last written at the bottom are almost invariably the poorest. The copy has been too far from the pupil's eye to be of any practical use, and the result is a repetition and exaggeration of his errors.

MACMILLAN & CO., LONDON.

WANTED, Clean Copies of NATURE, No. 472, for November 14, 1878. Address—Office of NATURE, 29, Bedford Street, Strand.

In fcap. 8vo, price 3*s*. 6*d*.

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic*.

LIGHTNING
CONDUCTORS:
THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.
By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.
With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street. 1880.

THE NEW BIOLOGICAL JOURNAL.
ARCHIVES DE BIOLOGIE.
Edited by Professors EDOUARD VAN BENEDEN of Liège, and VAN BAMBEKE of Ghent.

HOLLOWAYS OINTMENT A CERTAIN REMEDY
For BAD BREASTS, OLD WOUNDS, and SORES. If effectually rubbed on the Neck and Chest, it cures SORE THROATS, BRONCHITIS, COUGHS and COLDS; and for GOUT, RHEUMATISM, and all Skin Diseases it is unequalled.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

The Edition is limited to 1000 copies, all of which have been subscribed for; particulars as to price, &c., may be obtained from any bookseller.

LIFE OF WILLIAM BLAKE. With Selec-tions from his Poems and other Writings. By ALEXANDER GILCHRIST. A New and Enlarged Edition, Illustrated from BLAKE'S own Works, with Additional Letters and a Memoir of the Author. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. 2 vols., cloth gilt, elegant, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. £2 2s.

Several new Illustrations have been added to this work; among others the following may be named.—The Phillips Portrait of Blake; two new Portraits by Blake of his Wife; a new plate from the *Jerusalem*; a newly-discovered design to *Hamlet*; and a drawing of *Blake's Cottage at Felpham*. New Photogravures of the *Inventions to the Book of Job* are given. Some thirty additional letters are included in the Biographical portion of the work, forming a new link in the already interesting life of Blake. And Mr. W. M. Rossetti has revised, enlarged, and perfected the annotated catalogue of Blake's works that appeared in the first edition of the work [*Immediately.*

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds."—*Pall Mall Gazette.*

A VISIT TO WAZAN, THE SACRED CITY of MOROCCO. By ROBERT SPENCE WATSON. 8vo, with Map and Illustrations. 10s 6d.

"The result is one of the most delightful narratives we have had the good fortune to meet with for a very long time . . . In conclusion it remains to be said that Mr. Watson writes in a vigorous, scholarly style, manly and unaffected, oftentimes picturesque, but never descending to mere word-painting."—*Examiner.*

A DICTIONARY OF MUSIC AND MUSICIANS (A.D. 1450—1878). By Eminent Artists, English and Foreign. With Illustrations and Woodcuts. Edited by GEORGE GROVE, D.C.L. In three Volumes. Vols. I. and II., cloth. 21s. each.

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo. 6s

"Besides these answers to questions which greatly increase the value of the book, and make it almost an independent manual of the subject, Professor Jevons has taken occasion to supplement his previous works in various directions. It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITI-CAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

THE ARYAN VILLAGE IN INDIA AND CEYLON. By SIR JOHN B. PHEAR. Crown 8vo, 7s. 6d.

ALSO AN EDITION, Printed by Messrs R. and R. Clark, on hand-made paper. The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book."—*Graphic.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d. (New Volumes)

WORDSWORTH. By F. W. H. MYERS.
LOCKE. By Professor FOWLER.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Professor Fowler's for this particular work might have been sought, and sought in vain"—*Examiner.*

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s. 6d.

THE WHITE RAT, AND SOME OTHER STORIES. By LADY BARKER. Illustrated by W. J. HENNESSY. Globe 8vo. 4s. 6d.

PANSIE'S FLOUR BIN. By the Author of "When I was a Little Girl," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post.*

HISTORY OF THE ENGLISH PEOPLE. By JOHN RICHARD GREEN. Vol. IV. THE REVOLUTION, 1683—1760. MODERN ENGLAND, 1760—1815. 8vo, with 3 Maps and Index, 16s. (Vols I. to III 16s. each.) [*Concluding Volume.*

"A work that most students of history may turn to with advantage, and that will be almost sure to take rank among the great classics of our literature."—*Globe.*

READINGS FROM ENGLISH HISTORY. Selected and Edited by JOHN RICHARD GREEN, M.A., LL.D. In Three Parts, each 1s. 6d.

"We cannot imagine a better reading-book for the highest standard of our elementary schools, but it is a book which will have great charms also for the most cultivated readers."—*Guardian.*

Picturesque Europe. Complete in Five Volumes, with nearly 1000 Original Illustrations. Cloth gilt, £2 2s. each; morocco, £5 5s. each.

"Nothing on so grand a scale has been planned before, nor anything, so far as we know, so well executed."—*Spectator.*

The Magazine of Art. Vol. III., with upwards of 300 Illustrations. Cloth, gilt edges, 10s. 6d.

THE TIMES of Nov. 30th, 1880, says—

"Messrs. Cassell, Petter, Galpin & Co publish the third volume of their 'Magazine of Art' The title is no misnomer, for the book, within a convenient compass, contains a very storehouse of art. The illustrations are, of course, numerous, ranging from the finest of etchings and woodcuts up to the most elaborate engravings, the frontispiece containing a particularly good etching after Bonnat. The letterpress is particularly good and varied, being designed to suit all tastes, from the most to the least artistic."

N B.—The price of Vols. I. and II. of the Magazine of Art, *each containing about* 200 Illustrations, *has been raised from 7s. 6d. to 10s. 6d. each.*

Our Own Country. Vols. I. and II., with upwards of 200 Original Illustrations, and Steel Frontispiece in each. 7s. 6d. each.

"The beautiful work which Messrs Cassell & Co are publishing under the above title appeals to a very wide circle of readers. The treatment is full and comprehensive, embracing architecture, scenery, history and antiquities, industry and art, physical geography, and natural history The work is creditable to author, draughtsman, and engraver."—*The Times*

BUTLER, by Rev. Canon Collins, M.A. (*in January*).—BERKELEY, by Prof. Fraser, Edinburgh (*in February*).—FICHTE, by Prof. Adamson, Owens College, Manchester.—HAMILTON, by Prof. Veitch, Glasgow.—HUME, by the Editor.—BACON, by Prof. Nichol, Glasgow.—HEGEL, by Prof. Edward Caird, Glasgow.—HOBBES, by Prof. Croom Robertson, London.—KANT, by William Wallace, Merton College, Oxford.—SPINOZA, by Dr. Martineau, Principal of Manchester New College.—VICO, by Prof. Flint, Edinburgh.

Succeeding Volumes will include LOCKE, LEIBNITZ, COMTE, &c.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

CIVIL SERVICE COMMISSION.—Open

Competition in London, Edinburgh, and Dublin, for One Situation as SECOND ASSISTANT ASTRONOMER in the Royal Observatory, Edinburgh, January 18. Age, 17–33.—For Regulations and Forms of Application address the SECRETARY, London, S.W.

UNIVERSITY OF LONDON.

PRELIMINARY SCIENTIFIC AND 1ST M.B. EXAMINATIONS.

Special Classes in all the Subjects required for these Examinations will commence at St. Thomas's Hospital Medical School early in JANUARY. Full particulars may be obtained from the Secretary, Dr GILLESPIE.

SCIENCE TEACHING for YOUNG CHILDREN.

—Wanted, Gentleman or Lady to undertake this, living with the Family. Must have thorough knowledge of the subject. Also, if possible, Drawing.—Address Mr. HERBERT, Freshwater, Isle of Wight.

TO MUSEUMS, PUBLIC INSTITUTIONS, &c.

—Highly-coloured Diagrams of Insects suitable for exhibition in a Public Museum. Being facsimiles of the 38 Drawings of Coleoptera drawn by the late Mr. Murray, and now exhibited in the Science and Art Museum, Bethnal Green.—Apply, W. REDAWAY, 39, Robert Street, Hampstead Road, N.W.

ROYAL ASIATIC SOCIETY.

MONDAY, December 20, at 4 p.m., a Paper will be read, contributed by Prof. DOWSON, entitled "The Invention of the Indian Alphabet."

W. S. W. VAUX, Secretary R.A.S.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers the Infusorian, *Spirostomum teres* of Claparède and Lachman, with drawing. He has also sent out a very clean gathering of Desmids and Diatoms, including *Closterium lunula, didymotocum*, and *striolatum*, *Micrasterias denticulata*, *Tetmemorus granulatus*, and *Euastrum didelta*, with drawing of same.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

---

50 ROCKS, 50 FOSSILS, 50 MINERALS,

NEATLY ARRANGED IN A
DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.
EACH SPECIMEN LABELLED AND CATALOGUED.

Price complete, £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

THE FOSSILS are representative of the Genera found in the most important Deposits.

THE MINERALS are selected for their known uses in the Arts and Manufactures, and are extremely characteristic.

Names and Localities guaranteed.

THOMAS J. DOWNING, Geologist, &c.,
38, WHISKIN STREET, LONDON, E.C.
Catalogues Free.

MINERALOGY AND GEOLOGY.

MR. HENSON, who has just returned from Cornwall, has procured some VERY FINE CORNISH MINERALS, including some most splendid LARGE CRYSTALS of LIBETHENITE, and CHALCOSIDERITE, recently found.

FINE CRYSTALLISED CASSITERITE, LIROCONITE, BRILLIANT CUPRITE; also VERY GOOD CHALCOTRICHITE, BISMUTHINE, COPPER MICA, and HENWOODITE.

From Derbyshire, large Crystals of PHOSGENITE and MATLOCKITE.

From Sweden, VERY FINE AUGITE and AVANTURINE.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *via* SHEFFIELD.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY,

by Lyell, 1874, he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

ROCK SECTIONS & ROCK SPECIMENS.

Collections of Rock Specimens to illustrate Rutley's "Study of Rocks" specially prepared. 100 Small Specimens in Cabinet, One Guinea; 200 Specimens, Two Guineas. Extensive and choice Series of Rocks for selection. New List of Sections of Rocks for Microscope, and List of Collections, &c.

JAMES R. GREGORY'S
Extensive New Museum and Show Rooms,
88, CHARLOTTE STREET, FITZROY SQUARE.

MUSEUMS AND COLLECTORS.

MR. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

SCIENTIFIC PRESENTS.

1.

Facsimiles of 28 of the most celebrated White and Coloured Diamonds, wrought in Crystal Glass, of great lustre.

2.

Models of Natural Crystals of Diamonds, with other Models of Crystals of Coloured Precious Stones.

Each Set in handsome Morocco Case with Descriptive Catalogue.
Obtained the Bronze Medal, Paris Exhibition of 1878.
Address—Mr. R DAMON, Weymouth.

THIN GLASS FOR MICROSCOPIC

MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra, Ground edged Slips, 5s. per gross; also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro-Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY,

BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S., British Museum.

CONTENTS.—Original Articles by leading Botanists.—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News.—Proceedings of Societies

Price 1s. 3d. Subscription for One Year, payable in advance, 12s.
London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d., six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic point. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace has long devoted himself to these problems of geographical distribution; and his new volume gives us the cream of his latest thinking in a pleasant and eminently readable form. No other living naturalist has the same union of high literary excellence with profound scientific knowledge. His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The present volume, though in some respects intended as a popularisation of Mr. Wallace's previous works on the distribution of animals, yet contains an immense amount of new and important matter for the man of science, as well as much delightful reading for the less instructed public. It is, in fact, the final outcome of the author's most mature thought and research on the special subject which he has made most peculiarly his own. . . . The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

"Four years additional thought and research upon the lines laid down in that suggestive work 'The Geographical Distribution of Animals,' have brought to a conclusion the general scheme of inquiry which he from the first proposed to himself, and he now propounds, as a clear and definite theory, the results of investigations which might at first sight appear fragmentary and disconnected. Mr. Wallace has entitled himself to be called the father of the new science of zoological geography, showing that we have in the present distribution of living things over the earth's surface a key to the problems of the most ancient relations of land and water. . . . Mr. Wallace's survey of the widely-separated island system of the globe sets upon a solid basis his views of the wonderful powers of dispersion and modification existing in the organic world. . . . In his theory of local geographical changes modifying the general stability of continents we have perhaps a key to the most difficult and complex problems involved in the phenomena of the variation and distribution of living forms."—*Saturday Review.*

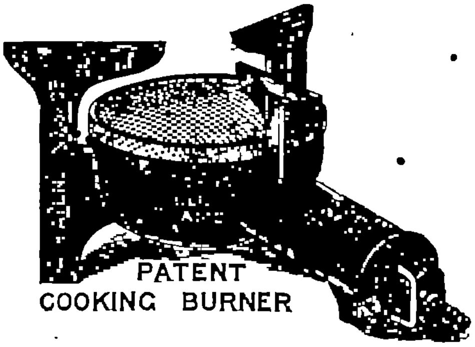
FLETCHER'S PERFECTED SOLID FLAME
GAS COOKING AND HEATING BURNER.
[PATENT, 3,203.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.
A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.
PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.

These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.

Complete Illustrated List, Price 3d., of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

Extra fcap. 8vo, 3s. 6d.
METALS and their CHIEF INDUSTRIAL
APPLICATIONS. By C. ALDER WRIGHT, D.Sc., Lecturer on Chemistry in St. Mary's Hospital Medical School. With Illustrations.
MACMILLAN & CO., LONDON.

With 112 Engravings and 5 Maps of the Stars
POPULAR ASTRONOMY.
BY
PROFESSOR S. NEWCOMB, LL.D.
8vo, cloth, price 18s

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO, LONDON

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least; frequent supplements and drawings. Subscription at any time; preceding numbers of the year furnished subsequently Price 12s. for twelve months. Advertisements 4d. a line, widely spread by this paper; considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall, 28. Edited by W. v. FREEDEN, M R., Hamburg, Alexander Strasse, 8.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

The Edition is limited to 1000 copies, all of which have been subscribed for; particulars as to price, &c., may be obtained from any bookseller.

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE'S own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. 2 vols., cloth gilt, elegant, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. £2 2s.

Several new Illustrations have been added to this work, which has long since taken its position as the standard authority on its subject; among others the following may be named:—The Phillips Portrait of Blake; two new Portraits by Blake of his Wife; a new plate from the *Jerusalem*; a newly-discovered design to *Hamlet*; and a drawing of *Blake's Cottage at Felpham*. New Photogravures of the *Inventions to the Book of Job* are given. Some thirty additional letters are included in the Biographical portion of the work, forming a new link in the already interesting life of Blake. And Mr. W. M. Rossetti has revised, enlarged, and perfected the annotated catalogue of Blake's works that appeared in the first edition of the work.

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds."—*Pall Mall Gazette.*

"He takes his subject matter from all the sciences, and he builds it into a new harmonious whole."—*Fortnightly Review.*

PHYSICS OF THE EARTH'S CRUST. By Rev. O. FISHER, M.A., F.G.S., Rector of Harlton, &c. 8vo. [*Shortly.*

A DICTIONARY OF MUSIC AND MUSICIANS (A.D. 1450—1878). By Eminent Artists, English and Foreign. With Illustrations and Woodcuts. Edited by GEORGE GROVE, D.C.L. In three Volumes. Parts I. to XVI. 3s. 6d. each. Vols. I. and II., cloth. 21s. each.

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song.

"Dr. Grove's Dictionary will be a boon to every intelligent lover of music."—*Saturday Review.*

IDEAL CHEMISTRY. By Sir BENJAMIN BRODIE, Bart., F.R.S. Crown 8vo. 2s.

FOOD FOR THE INVALID, THE CONVALESCENT, THE DYSPEPTIC, AND THE GOUTY. By J. MILNER FOTHERGILL, M.D., Author of "The Practitioner's Handbook," &c. Crown 8vo. 3s. 6d.

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo. 6s.

"Besides these answers to questions which greatly increase the value of the book, and make it almost an independent manual of the subject, Professor Jevons has taken occasion to supplement his previous works in various directions. . . It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments. . It is an admirable compendium and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

THE ARYAN VILLAGE IN INDIA AND CEYLON. By SIR JOHN B. PHEAR. Crown 8vo, 7s. 6d.

THE IRISH LAND LAWS. By ALEXANDER G. RICHEY, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists are called on to take part in the present controversy, the book will prove invaluable. The relation of the work to the discussions which now occupy so much attention is well expressed . . . . It would be difficult to find any series of legislative problems stated with greater clearness, sequence, and precision. We can recommend this little book to all who speak, write, or seriously think upon this question in or out of Parliament."—*The Times.*

With Twenty-five Illustrations by WALTER CRANE.

THE NECKLACE OF PRINCESS FIORIMONDE: and other Stories. By MARY DE MORGAN. Extra fcap. 8vo. 6s.

ALSO AN EDITION, Printed by Messrs. R. and R. Clark, on hand-made paper. The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap 4to.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book."—*Graphic.*

"A real gem."—*Punch.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d. (New Volumes.)

WORDSWORTH. By F. W. H. MYERS.

LOCKE. By Professor FOWLER.

"This is an exceedingly good little book."—*St. James's Gazette.*

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS. MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s. 6d.

"A very sweet and tenderly drawn sketch with life and reality manifest throughout. Very few can rival Mrs. Molesworth in the power of making us see the children of fancy, and in this 'Christmas Child' something has given to her pen a special power."—*Pall Mall Gazette.*

THE WHITE RAT, AND SOME OTHER STORIES. By LADY BARKER. Illustrated by W. J. HENNESSY. Globe 8vo. 4s. 6d.

PANSIE'S FLOUR BIN. By the Author of "When I was a Little Girl," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post.*

FIRST LESSONS IN GREEK. Adapted to Goodwin's "Greek Grammar," and designed as an Introduction to the "Anabasis" of Xenophon. By JOHN WILLIAMS WHITE, Ph.D., Assistant Professor of Greek in Harvard University. Crown 8vo. 4s. 6d.

XENOPHON'S ANABASIS. Books I.—IV. Edited by Professors W. W. GOODWIN and J. W. WHITE, of Harvard University. Fcap. 8vo. 5s. [Macmillan's Classical Series.

"This is an excellent school-book . . . . There are many editions of the Anabasis or its parts, but we are inclined to think that this is the best for a young scholar who is bent on making himself a good one."—*Dublin Evening Mail.*

THE STORY OF ACHILLES, FROM HOMER'S ILIAD. Edited, with Notes and Introduction, by the late J. H. PRATT, M.A., Fellow of Trinity College, Cambridge, Assistant-Master at Harrow; and WALTER LEAF, M.A., Fellow of Trinity College, Cambridge. Fcap. 8vo. 6s. [Macmillan's Classical Series.

LIVY.—SCENES FROM THE HANNIBALIAN WAR. Adapted for the use of Beginners by G. C. MACAULAY, M.A., Assistant-Master at Rugby. 18mo. 1s. 6d. [Macmillan's Elementary Classics.

"This is an adaptation of Livy's difficult text to the wants of beginners, the peculiarities of Livy's beautiful style being carefully, and most ingeniously preserved, while its difficulties are entirely removed . . We heartily recommend this little book for use in schools. There could be no better introduction to Livy nor to the art of Latin Prose Composition."—*Dublin Evening Mail.*

MACMILLAN'S PROGRESSIVE FRENCH COURSE. By EUGÈNE FASNACHT, Author of "Progressive German Course," &c. Third year, containing:—Systematic Syntax and Lessons in Composition. Fcap. 8vo. 2s. 6d.

MACMILLAN AND CO., LONDON.

STANDARD AND OBSERVATORY TIMEKEEPERS.

TRADE DENT MARK MANUFACTURED BY E. DENT & CO. TRADE DENT MARK

	Guineas.
Standard Clock, suitable for Private Residences in Town or Country, or Public Institutions, beating seconds and going eight days with once winding; in carved and decorated oak or mahogany case ... ... from	35
(*a*) The same, but going one Month with once winding ... ... from	40
Standard Observatory Mean-time Clock	80
(*a*) The same, but furnished with electrical contact apparatus with eccentric screw adjustments for dropping a time ball, or transmitting hourly signals	92
Standard Observatory Sidereal Clock	80
(*a*) The same, but furnished with electrical contact apparatus with fine vertical and horizontal screw adjustments for transmitting seconds, currents for controlling other clocks, &c.	95
(*b*) The same, but arranged to omit the current at every 60th second, for pricking on chronograph barrel, &c.	97

	Guineas.
Standard Observatory Clock, of the most refined construction, with barometric compensation, &c. ...	160
(*a*) The same, with Sir Geo. Airy's escapement ...	170
(*b*) The same, with M. Leverrier's electrical contact system	200

The New Standard Clock (the primary standard timekeeper of the United Kingdom) of the Royal Observatory, Greenwich, was constructed by E. Dent & Co., and precisely similar instruments are now being made for the Royal Observatories of Spain and Belgium. Standard Clocks of less refined construction for the Observatories of Edinburgh (Royal), Dunsink (Royal Irish), Oxford (University), Pulkowa (Russian Imperial), Geneva (National Swiss); and many others, Foreign and Colonial, have been manufactured.

Galvanic Chronographic Apparatus, for registering the time of occurrence of transits and other astronomical phenomena ... ... from	120

The Great Galvanic Chronograph of the Royal Observatory, Greenwich, and the still more powerful Apparatus for the Royal Observatory, Brussels, and other smaller ones for other Observatories were constructed by E. Dent & Co.

LA SEMAINE FRANÇAISE: a Weekly

Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street. Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d., six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

LIGHTNING CONDUCTORS:

THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street. 1880.

EDITED BY HENRY WATTS, B.A., F.R.S.,

FOWNES' PHYSICAL and INORGANIC

CHEMISTRY. Twelfth Edition, with Coloured Plate and 154 Engravings, crown 8vo. 8s. 6d.

Also,

FOWNES' CHEMISTRY OF CARBON

COMPOUNDS; or, ORGANIC CHEMISTRY. Twelfth Edition, with Engravings, crown 8vo 10s.

London: J. & A. CHURCHILL.

New Edition, very much enlarged, 21s.

HOW TO WORK WITH THE MICROSCOPE.

By LIONEL S. BEALE, F.R.S.,
President of the Royal Microscopical Society.

THE FIFTH EDITION,
Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.

HARRISON & SONS, Pall Mall

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liége, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter.

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription: Twenty-five Shillings, or Twenty-seven Shillings post free

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London.

In the first two numbers have appeared:—

VAN BENEDEN: On the Embryology of the Mammalia.
VAN BAMBEKE: On the Cleavage of the Egg in Batrachia.
FOX HINGER: On the Termination of Nerves in the Muscles of Insects.
FREDERIQUE AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.
MACLEOD: On the Harderian Gland of the Duck, &c., &c.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish, new or rare marine fish; local aquaria; British reptiles, British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

HOLLOWAY'S OINTMENT A CERTAIN REMEDY

For BAD BREASTS, OLD WOUNDS, and SORES. If effectually rubbed on the Neck and Chest, it cures SORE THROATS, BRONCHITIS, COUGHS and COLDS; and for GOUT, RHEUMATISM, and all Skin Diseases it is unequalled.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

FRANCE. By CHARLOTTE M. YONGE. With Maps.

*** *Others in preparation.*

MACMILLAN & CO., BEDFORD STREET, STRAND, W.C.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

ETCHING AND ETCHERS. By P. G. HAMERTON. New Edition, Revised, with 48 New Plates. Columbier 8vo.

The text of the new Edition has been thoroughly revised, and increased by one-fifth. Several new Chapters and a new Preface have been added, whilst matter which had become unnecessary or disproportionate has been removed, to make room for studies of more importance. [*Immediately.*

The Edition is limited to 1000 copies, all of which have been subscribed for; particulars as to price, &c., may be obtained from any bookseller.

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE'S own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. 2 vols., cloth gilt, elegant, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. £2 2s.

Several new Illustrations have been added to this work, which has long since taken its position as the standard authority on its subject; among others the following may be named:—The Phillips Portrait of Blake; two new Portraits by Blake of his Wife; a new plate from the *Jerusalem*; a newly-discovered design to *Hamlet*; and a drawing of *Blake's Cottage at Felpham*. New Photogravures of the *Inventions to the Book of Job* are given. Some thirty additional letters are included in the Biographical portion of the work, forming a new link in the already interesting life of Blake. And Mr. W. M. Rossetti has revised, enlarged, and perfected the annotated catalogue of Blake's works that appeared in the first edition of the work.

"One of the most beautiful and interesting books of the season."—*Daily News.*

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"He takes his subject matter from all the sciences, and he builds it into a new harmonious whole."—*Fortnightly Review.*

PHYSICS OF THE EARTH'S CRUST. By Rev. O. FISHER, M.A., F.G.S., Rector of Harlton, &c. 8vo. [*Shortly.*

A DICTIONARY OF MUSIC AND MUSICIANS (A.D. 1450—1878). By Eminent Artists, English and Foreign. With Illustrations and Woodcuts. Edited by GEORGE GROVE, D.C.L. In three Volumes. Parts I. to XII. 3s. 6d. each. Vols. I. and II., cloth, 21s. each.

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song.

"Dr. Grove's Dictionary will be a boon to every intelligent lover of music."—*Saturday Review.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d. (New Volume.)
WORDSWORTH. By F. W. H. MYERS.

GILBERT WHITE'S NATURAL HISTORY AND ANTIQUITIES OF SELBORNE. New Edition, with a Poem and Letters never before published. Edited, with Notes and Memoir by FRANK BUCKLAND; a chapter on Antiquities by Lord SELBORNE; and the Garden Kalendar. With Original Illustrations from Drawings by Professor DELAMOTTE, taken at Selborne, and from many interesting and curious objects supplied by the Editor. Cheap Edition. Globe 8vo. 6s.

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., M.A., F.R.S. Crown 8vo. 6s.

"Besides these answers to questions which greatly increase the value of the book, and make it almost an independent manual of the subject, Professor Jevons has taken occasion to supplement his previous works in various directions. . . It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo, 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments. . . It is an admirable compendium and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

THE LIFE'S WORK IN IRELAND OF A LANDLORD WHO TRIED TO DO HIS DUTY. By W. BENCE JONES of Lisselan. Crown 8vo. 6s. [*Immediately.*

NEW VIEWS ON IRELAND: IRISH LAND GRIEVANCES AND REMEDIES. By CHARLES RUSSELL, Q.C., M.P. Crown 8vo. 2s. 6d. [*Immediately.*

THE IRISH LAND LAWS. By ALEXANDER G. RICHEY, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists are called on to take part in the present controversy, the book will prove invaluable. The relation of the work to the discussions which now occupy so much attention is well expressed. . . . . It would be difficult to find any series of legislative problems stated with greater clearness, sequence, and precision. We can recommend this little book to all who speak, write, or seriously think upon this question in or out of Parliament."—*The Times.*

THE NECKLACE OF PRINCESS FIORIMONDE: and other Stories. By MARY DE MORGAN. With Twenty-five Illustrations by WALTER CRANE. Extra fcap. 8vo. 6s.

ALSO AN EDITION, Printed by Messrs. R. and R. Clark, on hand-made paper. The Plates, initial letters, head and tail pieces being printed on India paper and mounted in the text.

The Edition is limited to ONE HUNDRED COPIES. Fcap. 4to.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book."—*Graphic.*

"A real gem."—*Punch.*

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS. MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s. 6d.

"A very sweet and tenderly drawn sketch with life and reality manifest throughout. Very few can rival Mrs. Molesworth in the power of making us see the children of fancy, and in this 'Christmas Child' something has given to her pen a special power."—*Pall Mall Gazette.*

THE WHITE RAT, AND SOME OTHER STORIES. By LADY BARKER. Illustrated by W. J. HENNESSY. Globe 8vo. 4s. 6d.

"A pleasant little volume. It is pretty outside and pleasant in."—*Morning Post.*

PANSIE'S FLOUR BIN. By the Author of "When I was a Little Girl," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post.*

XENOPHON'S ANABASIS. Books I.—IV. Edited by Professors W. W. GOODWIN and J. W. WHITE, of Harvard University. Fcap. 8vo. 5s. [Macmillan's Classical Series.

"This is an excellent school-book . . . . There are many editions of the Anabasis or its parts, but we are inclined to think that this is the best for a young scholar who is bent on making himself a good one."—*Dublin Evening Mail.*

THE STORY OF ACHILLES, FROM HOMER'S ILIAD. Edited, with Notes and Introduction, by the late J. H. PRATT, M.A., Fellow of Trinity College, Cambridge, Assistant-Master at Harrow; and WALTER LEAF, M.A., Fellow of Trinity College, Cambridge. Fcap. 8vo. 6s. [Macmillan's Classical Series.

LIVY.—SCENES FROM THE HANNIBALIAN WAR. Adapted for the use of Beginners by G. C. MACAULAY, M.A., Assistant-Master at Rugby. 18mo. 1s. 6d. [Macmillan's Elementary Classics.

"This is an adaptation of Livy's difficult text to the wants of beginners, the peculiarities of Livy's beautiful style being carefully, and most ingeniously preserved, while its difficulties are entirely removed . . . We heartily recommend this little book for use in schools. There could be no better introduction to Livy nor to the art of Latin Prose Composition."—*Dublin Evening Mail.*

MACMILLAN'S FRENCH READER. Second year, containing Fiction in Prose and Verse, Historical and Descriptive Extracts; Essays, Letters, and Dialogues, &c. By EUGÈNE FASNACHT, Author of Macmillan's Progressive French and German Courses, &c. Extra fcap. 2s. 6d.

MACMILLAN AND CO., LONDON.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, December 16, 1880.

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings o the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson; Jun., Edinburgh.
ESTABLISHED 1843.

TO BOTANISTS AND HORTICULTURISTS:

I have just succeeded in obtaining the few remaining Copies of the following high-Class Botanical Works, privately printed at the expense of the Authors, and offer them whilst the *very limited* stock lasts at the prices affixed.

ELWES'S (H. J.) MONOGRAPH OF THE Genus LILIUM, complete in 7 Parts, impl. folio, two Maps, Photograph, and 48 superbly Coloured Plates of every known Species of Lilies, engraved by FITCH, often two Species on one Plate, stitched, £9 9s. 1880

Only 250 copies were issued for subscribers.

The Author, a wealthy gentleman living at Preston House, Cirencester, Gloucestershire, where he possesses fine and extensive garden grounds, has, by great energy and at vast expense, brought together ALL THE KNOWN SPECIES OF LILIES.

CLARKE (C. B., Superintendent of the Calcutta Botanic Garden), COMMELYNACEÆ et CYRTANDRACEÆ BENGALENSES, royal folio, 95 fine large Plates, with accurate Structural Details and Descriptive Text, Boards, 20s. Calcutta, 1874

Very few copies of this learned and valuable botanical work have come to England and Europe, and none have gone yet to America.

BOOTT (F.), ILLUSTRATIONS OF THE GENUS CAREX, 4 vols., folio, 600 Plates, containing several thousand Figures, £25 1858-67

This valuable book must rise in price, as only half-a-dozen copies remain for sale. The most valuable and exhaustive work on the Grasses of the whole world, containing 600 Plates of the full size of nature, most beautifully drawn by M. Maubert of Paris, and engraved on copper under the guidance and inspection of M. Spach.

BERNARD QUARITCH, 15 Piccadilly, London.

⁂ A Catalogue of my Botanical Works is in Preparation.

EXERCISES in PRACTICAL CHEMISTRY Vol. I. (ELEMENTARY EXERCISES). By A. G. VERNON HARCOURT, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry; and H. G. MADAN, M.A., Fellow of Queen's College, Oxford. Third Edition, Revised and considerably Enlarged, crown 8vo, cloth, 9*s*.

London: HENRY FROWDE, Clarendon Press Warehouse, 7, Paternoster Row.

EDITED BY HENRY WATTS, B.A., F.R.S.,
Editor of the *Journal* of the Chemical Society

FOWNES' PHYSICAL and INORGANIC CHEMISTRY. Twelfth Edition, with Coloured Plate and 154 Engravings, crown 8vo. 8*s*. 6*d*.

Also,

FOWNES' CHEMISTRY OF CARBON COMPOUNDS; or, ORGANIC CHEMISTRY. Twelfth Edition, with Engravings, crown 8vo. 10*s*.

London: J. & A. CHURCHILL.

"NATURE," Nov. 7, 1878.—One Shilling each will be paid for Copies of this number.—Address Publishers of NATURE, 29, Bedford Street, Strand, W.C.

THE SCIENTIFIC RESULTS OF THE VOYAGE OF H.M.S. "CHALLENGER."

Now ready, Copiously Illustrated, in imp. 4to, price 37*s*. 6*d*.

REPORT on the SCIENTIFIC RESULTS of the VOYAGE of H.M.S. "CHALLENGER" during the YEARS 1873-6, under the Command of Capt. G. S. NARES, R.N., F.R.S., and Capt. F. T. THOMSON, R.N. Prepared under the Superintendence of Sir C. WYVILLE THOMSON, Knt., F.R.S., &c. (Provisional Title) ZOOLOGY—Vol. I. (containing a Provisional Introduction to the Zoological Section by Sir C. WYVILLE THOMSON, and Six Memoirs).

*** This Volume may be had also in Six Separate Parts as follows:—

PART I. *Brachiopoda.* (THOMAS DAVIDSON, F.R.S., &c.) Price 2*s*. 6*d*.
,, II. *Pennatulida.* (Prof. ALBERT KOLLIKER, F.M.R.S., &c.) Price 4*s*.
,, III. *Ostracoda.* (G. STEWARDSON BRADY, M.D., &c.) Price 15*s*.
,, IV. *Bones of Cetacea.* (WM. TURNER, M.B. Lond., &c.) Price 2*s*.
,, V. *Development of the Green Turtle.* (WM. KITCHEN PARKER, F.R.S.) Price 4*s* 6*d*.
,, VI. *The Shore Fishes.* (ALBERT GÜNTHER, M.A., &c.) Price 10*s*.

*** Published by Order of H.M. Government, and Printed for H.M. Stationery Office.

ZOOLOGY—Vol. II., containing Memoirs on certain Hydroid, Alcyonarian, and Madreporarian Corals, and on the Birds, is nearly ready.

London: LONGMANS & CO., JOHN MURRAY, MACMILLAN & CO., SIMPKIN, MARSHALL, & CO., TRÜBNER & CO., E. STANFORD, J. D. POTTER, and C. KEGAN PAUL & CO. Edinburgh: A. & C. BLACK and DOUGLAS & FOULIS. Dublin: A. THOM & CO., and HODGES, FOSTER, & FIGGIS.

Second Edition, with Maps, price 10*s*. 6*d*., pp. 447.

EPIDEMIOLOGY; or, The Cause of Epidemic Disease, of Murrains, of Blight, of Hurricanes, and of Abnormal Atmospherical Vicissitudes. With a History of Epidemic Diseases, and of the Phenomena that accompanied them. By JOHN PARKIN, M.D.

DAVID BOGUE, St. Martin's Place, London, W.C.

NEW WORK BY LIONEL S. BEALE.

Now ready, pp. 230, *demy 8vo*, 5*s*.

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.

By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.,
Professor of the Principles and Practice of Medicine in King's College, London.

SOUND: ELEMENTARY LESSONS ON.
By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

MACMILLAN & CO., LONDON.

YORK'S
SERIES of SCIENTIFIC OPTICAL LANTERN SLIDES
Comprise over 2,000 of the following subjects:—Electricity, Magnetism, Sound, Telephone, Microphone, Electric Light, Light, Spectrum Analysis, Astronomy, Mines and Miners, Heat, Mechanics, Hydrostatics, Pneumatics, Human Physiology. Sample Slide and Catalogue sent on receipt of 2*s.*
F. YORK, OPTICAL LANTERN SLIDE MANUFACTURER,
87, Lancaster Road, Notting Hill, London, W.

HOLLOWAY'S PILLS THIS MEDICINE
Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints.

LIGHTNING CONDUCTORS.
Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,
As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.
It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.
R. S. NEWALL & CO., 130, STRAND, W.C.

EXTRACT
J. S. FRY & SONS, Bristol and London.

WESLEY COLLEGE, SHEFFIELD.

(*Affiliated to the London University*, 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A., LL.D.
Second Master, R. SHINDLER, Esq., M.A. (Lond.).
And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is fully adapted to the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for the Universities, training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal and Instrumental Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, and gives Weekly Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

W. LADD & CO.,

SCIENTIFIC INSTRUMENT MANUFACTURERS,
(*By Appointment to the Royal Institution of Great Britain*),
11 AND 12, BEAK STREET, REGENT STREET, W.

IMPROVED HOLTZ ELECTRICAL MACHINES. GRAMME'S MAGNETO-ELECTRIC MACHINE for Laboratory use.
PHOSPHORESCENT POWDER—very brilliant—for Paint and other purposes, 5*s.* per oz.
Physical Apparatus of every Description.

ILLUSTRATED CATALOGUE, SIXPENCE.

PATERSON'S NEW CATALOGUE OF PHYSICAL APPARATUS.

LANTERN SLIDES for SCIENTIFIC LECTURES. Season 1880–1. Post free 6 Stamps.
Complete Sets of Physical Apparatus for Science Primers and all the Physical Text-books in use in Schools and Colleges.
Siemens and Gramme Dynamo Machines and Lamps for hire.
Schools supplied with Apparatus as per Science and Art Departments' Requirements in the Sections of Light, Heat, Sound, and Electricity.
Electric Signals for Houses, Hotels, &c., Colliery Signals, Lightning Conductors. The Gower-Bell Loud-speaking Telephone.

EDWARD PATERSON, Electrical Engineer.

SHOW ROOMS AND STEAM WORKS:—76, LITTLE BRITAIN, E.C. (late 3, Bedford Court, W.C.).
MOLISON'S HARMONOGRAPH; executes the Harmonic Curves in the most perfect manner. 15*s.* and 20*s.*
Illustrated Catalogue of Electrical Apparatus, Part 1, *post free*, 6 *Stamps. Ditto, Electric Signals, Part* 2, 6 *Stamps.*

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21*s.*

Just ready. 44 pages 8vo. 1*s.*

CORRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy.*

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum.*

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic.*

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory.*

MACMILLAN AND CO., LONDON.

In Medium 8vo, price 18*s.* Vol. I.

A TREATISE ON

COMPARATIVE EMBRYOLOGY.

By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. In Two Vols. Illustrated.

"It is scarcely possible to exaggerate the expressions of gratitude which are due from zoologists to Mr. Balfour for the execution of the great task which some three or four years ago he set himself. . . . Zoologists have to be thankful to him for the admirable style in which he has carried out his work."—*Nature.*

SCIENCE PRIMERS.

UNDER THE JOINT EDITORSHIP OF

PROFESSORS HUXLEY, ROSCOE, AND BALFOUR STEWART.

In 18mo, cloth, with Illustrations, price 1*s*. each.

INTRODUCTORY PRIMER. By Professor HUXLEY, F.R.S.

CHEMISTRY. By H. E. ROSCOE, F.R.S., Professor of Chemistry, the Victoria University, the Owens College, Manchester. With Questions.

PHYSICS. By BALFOUR STEWART, F.R.S., Professor of Natural Philosophy, the Victoria University, the Owens College, Manchester. With Questions.

GEOLOGY. By ARCHIBALD GEIKIE, F.R.S., Professor of Geology, Edinburgh.

PHYSICAL GEOGRAPHY. By Prof. GEIKIE, F.R.S. With Questions.

PHYSIOLOGY. By MICHAEL FOSTER, M.D., F.R.S.

ASTRONOMY. By J. N. LOCKYER, F.R.S.

BOTANY. By SIR J. D. HOOKER, K.C.S.I., C.B., F.R.S.

LOGIC. By W. STANLEY JEVONS, LL.D., M.A., F.R.S.

POLITICAL ECONOMY. By W STANLEY JEVONS, M.A., LL.D., F.R.S.

*** *Others in preparation.*

HISTORY AND LITERATURE PRIMERS.

EDITED BY

JOHN RICHARD GREEN, M.A., LL.D.,

AUTHOR OF "A SHORT HISTORY OF THE ENGLISH PEOPLE."

In 18mo, cloth, price 1*s*. each.

HOMER. By the Right Hon. W. E. GLADSTONE, M.P.

ENGLISH GRAMMAR. By the Rev. R. MORRIS, LL.D.

ROME. By the Rev. M. CREIGHTON, M.A. With Maps.

GREECE. By C. A. FYFFE, M.A. With Maps.

ENGLISH LITERATURE. By STOPFORD BROOKE, M.A.

EUROPE. By E. A. FREEMAN, D.C.L., LL.D., M.A. With Maps.

GREEK ANTIQUITIES. By J. P. MAHAFFY, M.A. Illustrated.

ROMAN ANTIQUITIES. By Prof. A. S. WILKINS. Illustrated.

CLASSICAL GEOGRAPHY. By H. F. TOZER, M.A.

GEOGRAPHY. By GEORGE GROVE, D.C.L., F.R.G.S. With Maps.

CHILDREN'S TREASURY of LYRICAL POETRY. By F. T. PALGRAVE. In Two Parts, each, 1*s*.

SHAKSPERE. By Prof. DOWDEN.

PHILOLOGY. By J. PEILE, M.A.

GREEK LITERATURE. By Prof. JEBB, M.A., LL.D.

ENGLISH GRAMMAR EXERCISES. By R. MORRIS, LL.D., and H. C. BOWEN, M.A.

ENGLISH COMPOSITION. By Prof. NICHOL.

FRANCE. By CHARLOTTE M. YONGE. With Maps.

*** *Others in preparation.*

MACMILLAN & CO., BEDFORD STREET, STRAND, W.C.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

NEW BOOKS ON IRELAND.

NEW VIEWS ON IRELAND; or, Irish Land Grievances and Remedies. By CHARLES RUSSELL, Q.C., M.P. Crown 8vo. 2s. 6d.

THE LIFE'S WORK IN IRELAND OF A LANDLORD WHO TRIED TO DO HIS DUTY. By W. BENCE JONES of Lisselan. Crown 8vo. 6s.

THE IRISH LAND LAWS. By ALEXANDER G. RICHEY, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists, are called on to take part in the present controversy, the book will prove invaluable."—*The Times.*

"This book cannot fail to do good."—*St. James's Gazette.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE's own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. 2 vols., cloth elegant, gilt, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. 42s.

Several new Illustrations have been added to this work, which has long since taken its position as the standard authority on its subject. Among others, the following may be mentioned:—The Phillips Portrait of Blake; two new Portraits by Blake of his Wife; a new Plate from the *Jerusalem*; a newly-discovered Design to *Hamlet*; and a Drawing of *Blake's Cottage at Felpham.* New Photogravures of the *Inventions to the Book of Job* are given. Some thirty additional Letters are included in the Biographical portion of the work, forming a new link to the already interesting life of Blake. Mr. W. M. Rossetti has revised, enlarged, and perfected the *Annotated Catalogue of Blake's Works* that appeared in the First Edition of the book.

"One of the most beautiful and interesting books of the season...... Thus Blake, more than Thoreau, and infinitely more than Rousseau, is a shining example of a man who chose and secured a simple and sufficient measure of happiness. There is no higher philosophy."—*Daily News.*

THE ABBOTT'S FARM; or, Practice with Science. By HENRY TANNER, M.R.A.C., F.C.S., Professor of the Principles of Agriculture in the Royal Agricultural College, Author of "First Principles of Agriculture." Extra fcap. 3s. 6d.

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"He takes his subject matter from all the sciences, and he builds it into a new harmonious whole."—*Fortnightly Review.*

GILBERT WHITE'S NATURAL HISTORY AND ANTIQUITIES OF SELBORNE. New Edition, with a Poem and Letters never before published. Edited, with Notes and Memoir, by FRANK BUCKLAND; a chapter on Antiquities by Lord SELBORNE; and the Garden-Kalendar. With Illustrations by Prof. DELAMOTTE. Cheap Edition. Crown 8vo. 6s.

PHYSICS OF THE EARTH'S CRUST. By Rev. O. FISHER, M.A., F.G.S., Rector of Harlton, &c. 8vo. [*Shortly.*

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., M.A., F.R.S. Crown 8vo. 6s.

"It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments. . . It is an admirable compendium and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

THE WHITE RAT, AND SOME OTHER STORIES. By LADY BARKER. Illustrated by W. J. HENNESSY. Globe 8vo. 4s. 6d.

"A pleasant little volume. It is pretty outside, and pleasant in."—*Morning Post.*

GOLDEN TREASURY SERIES.—NEW VOLUME.

ESSAYS OF JOSEPH ADDISON. Chosen and Edited by JOHN RICHARD GREEN, M.A., LL.D. 18mo. 4s. 6d.

Tickets may be had at the Museum in Jermyn Street (where the Lectures will be delivered), by Working Men only, on Monday evening, January 3rd, from 6 to 10 o'clock, on payment of 6d. Each applicant is requested to bring his name, address, and occupation written on paper, for which the Ticket will be exchanged.

F. W. RUDLER, Registrar.

JAWS or TEETH of LOWER TERTIARY

MAMMALS wanted, at reasonable price.—Address Mr. HERBERT, Freshwater, Isle of Wight.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

GEOLOGY.—In the Preface to the STU-

DENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays — — —	£2	2	0
200 Specimens, in Cabinet, with 5 Trays — — —	5	5	0
300 Specimens, in Cabinet, with 9 Drawers — —	10	10	0
400 Specimens, in Cabinet, with 13 Drawers — —	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

MINERALOGY AND GEOLOGY.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

WESLEY COLLEGE, SHEFFIELD.

(*Affiliated to the London University*, 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A., LL.D.
Second Master, R. SHINDLER, Esq., M.A. (Lond.).
And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is fully adapted to the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for the Universities, training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal and Instrumental Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, and gives Weekly Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3*d.* WEEKLY)

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3*s.* 9½*d.*; 6 months, 7*s.* 7*d.*; 12 months, 15*s.* 2*d.*

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s.* each; the succeeding vols. may be had separately or together, at 7*s.* each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3*d.*, through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½*d.*, en timbres poste. LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street. 1880.

New Edition, very much enlarged, 21s.

By the same Author.

Demy 8vo, with 37 Plates, cloth, 30s.

PHOTOGRAPHED SPECTRA.

One Hundred and Thirty-Six Photographs of Metallic, Gaseous, and other Spectra, printed by the Permanent Autotype Process, with Introduction, Description of Plates, and Index, and with an Extra Plate of the Solar Spectrum (showing bright lines) compared with the Air Spectrum.

London: E. & F. N. SPON, 16, Charing Cross.

In fcap. 8vo, price 3s. 6d.

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

OFFICE OF "NATURE," 29, BEDFORD STREET, STRAND.

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21s.

Just ready. 44 pages 8vo. 1s.

CORRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy.*

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum.*

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic.*

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory.*

MACMILLAN AND CO., LONDON.

MESSRS. MACMILLAN & CO.'S PUBLICATIONS.

NEW BOOKS ON IRELAND.

NEW VIEWS ON IRELAND; or, Irish Land Grievances and Remedies. By CHARLES RUSSELL, Q.C., M.P. Crown 8vo. 2s. 6d.

THE LIFE'S WORK IN IRELAND OF A LANDLORD WHO TRIED TO DO HIS DUTY. By W. BENCE JONES of Lisselan. Crown 8vo. 6s.

THE IRISH LAND LAWS. By ALEXANDER G. RICHEY, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists, are called on to take part in the present controversy, the book will prove invaluable."—*The Times.*

"This book cannot fail to do good."—*St. James's Gazette.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE's own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. 2 vols. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. Cloth elegant, gilt, with designs after BLAKE by FREDK J. SHIELDS. Medium 8vo. 42s.

"One of the most beautiful and interesting books of the season.——Thus Blake, more than Thoreau, and infinitely more than Rousseau, is a shining example of a man who chose and secured a simple and sufficient measure of happiness. There is no higher philosophy."—*Daily News.*

THE ABBOTT'S FARM; or, Practice with Science. By HENRY TANNER, M.R.A.C., F.C.S., Professor of the Principles of Agriculture in the Royal Agricultural College, Author of "First Principles of Agriculture." Extra fcap. 3s. 6d.

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"He takes his subject matter from all the sciences, and he builds it into a new harmonious whole."—*Fortnightly Review.*

GILBERT WHITE'S NATURAL HISTORY AND ANTIQUITIES OF SELBORNE. New Edition, with a Poem and Letters never before published. Edited, with Notes and Memoir, by FRANK BUCKLAND; a chapter on Antiquities by Lord SELBORNE; and the Garden Kalendar. With Illustrations by Prof. DELAMOTTE. Cheap Edition. Crown 8vo. 6s.

PHYSICS OF THE EARTH'S CRUST. By Rev. O. FISHER, M.A., F.G.S., Rector of Harlton, &c. 8vo. [*Shortly.*

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., M.A., F.R.S. Crown 8vo. 6s.

"It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments. . It is an admirable compendium, and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

THE WHITE RAT, AND SOME OTHER STORIES. By LADY BARKER. Illustrated by W. J. HENNESSY. Globe 8vo. 4s. 6d.

"A pleasant little volume. It is pretty outside, and pleasant in."—*Morning Post.*

GOLDEN TREASURY SERIES.—NEW VOLUME.

ESSAYS OF JOSEPH ADDISON. Chosen and Edited by JOHN RICHARD GREEN, M.A., LL.D. 18mo. 4s. 6d.

DICTIONARY OF MUSIC AND MUSICIANS (A.D. 1450—1878). By eminent Writers, English and Foreign. Edited by GEORGE GROVE, D.C.L. Three Vols., 8vo, with Illustrations and Woodcuts. Parts I. to XII. each 3s. 6d. Vols. I. and II., 8vo, cloth, each 21s.

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song

"This work promises to be for music what the best encyclopædias are to general literature and science."—*Guardian.*

ENGLISH POETS: Selections, with Critical Introductions by various Writers, and a General Introduction by MATTHEW ARNOLD. Edited by T. H. WARD, M.A. 4 vols., crown 8vo, each 7s. 6d.

Vol. I. CHAUCER to DONNE.
Vol. II. BEN JONSON to DRYDEN.
Vol. III. ADDISON to BLAKE.
Vol. IV. WORDSWORTH to SYDNEY DOBELL.

"An excellent design admirably executed."—*Pall Mall Gazette*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. Crown 8vo. 2s. 6d. (New Volume)

WORDSWORTH. By F. W. H. MYERS.

THE YEAR'S ART: A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE, which have occurred during the Year, together with information respecting the events of the Year 1881. Compiled by MARCUS B. HUISH, Crown 8vo. 2s. 6d.

THE NECKLACE OF PRINCESS FIORIMONDE; and other Stories. By MARY DE MORGAN. With Twenty-five Illustrations by WALTER CRANE. Fcap. 8vo. 6s.

Also an Edition of One Hundred Copies on large paper.

"The stories display considerable originality, and Mr. Crane's characteristic illustrations combine with Miss de Morgan's pretty fancies to form a charming gift-book."—*Graphic.*

"A real gem."—*Punch.*

A CHRISTMAS CHILD: a Sketch of a Boy-life. By MRS. MOLESWORTH, Author of "Carrots," "The Cuckoo Clock," &c. Illustrated by WALTER CRANE. Globe 8vo. 4s 6d.

"A very sweet and tenderly drawn sketch with life and reality manifest throughout. Very few can rival Mrs Molesworth in the power of making us see the children of fancy, and in this 'Christmas Child' something has given to her pen a special power."—*Pall Mall Gazette.*

PANSIE'S FLOUR BIN. By the Author of "When I was a Little Girl," &c. Illustrated by ADRIAN STOKES. Globe 8vo. 4s. 6d.

"Worthy to be classed with 'Alice in Wonderland,' and in some respects is better adapted to juvenile comprehension."—*Morning Post.*

*** *Messrs. MACMILLAN & Co.'s Illustrated Catalogue of Gift and Presentation Books is now ready, and may be obtained on application.*

MACMILLAN & CO., BEDFORD STREET, STRAND, W.C.

Now ready, PART I, Price 7d.

The Royal Shakspere.

With numerous *FULL-PAGE ILLUSTRATIONS* on *STEEL* and WOOD, from Original Designs by F. DICKSEE, F. BARNARD, A. HOPKINS, J. D. WATSON, V. W. BROMLEY, C. GREEN, J. M'L. RALSTON, &c. &c.

Collections of Rock Specimens to illustrate Rutley's "Study of Rocks" specially prepared. 100 Small Specimens in Cabinet, One Guinea, 200 Specimens, Two Guineas. Extensive and choice Series of Rocks for selection. New List of Sections of Rocks for Microscope, and List of Collections, &c.

JAMES R. GREGORY'S
Extensive New Museum and Show Rooms,
88, CHARLOTTE STREET, FITZROY SQUARE.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

LIVING SPECIMENS FOR THE MICROSCOPE.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s*. each; the succeeding vols. may be had separately or together, at 7*s*. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price One Shilling.

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology, habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish, new or rare marine fish; local aquaria, British reptiles, British land and fresh-water mollusca, with remarks on the haunts and habits of the species, and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

London: DAVID BOGUE, 3, St. Martin's Place, Trafalgar Square, W.C.

WESLEY COLLEGE, SHEFFIELD.

(*Affiliated to the London University*, 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A., LL.D.
Second Master, R. SHINDLER, Esq., M.A. (Lond.).
And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is fully adapted to the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for the Universities, training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal and Instrumental Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, and gives Weekly Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18s

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation"—*Nature*.

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review*.

A TEXT-BOOK OF THE

PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY,

INCLUDING

AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.

BY ARTHUR GAMGEE, M.D., F.R.S.,

Professor of Physiology in the Victoria University, the Owens College, Manchester.

LONDON: MACMILLAN AND CO.

This work, of which the first volume is now published, and of which the second and concluding volume will be published in 1881, aims at giving a more complete account of the present state of physiological and pathological chemistry than is to be found in any of the existing text-books. The special features of the work are the following:—

First.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of the pure chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a biological question. The classification adopted is, however, based upon physiological and pathological rather than chemical considerations.

Secondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those methods of research which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are given of methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the most important to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired to science, but wishful himself to extend her boundaries. Methods of analysis are described with great care, so as to render the work a trustworthy laboratory guide for the student of physiological chemistry and the practical physician.

Thirdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making researches being given, and the full titles of nearly all papers quoted being given.

Fourthly.—The work is copiously illustrated, the illustrations being in many cases original.

Fifthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary tissues of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal processes.

With Illustrations and Maps, medium 8vo, 18s.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace has long devoted himself to these problems of geographical distribution; and his new volume gives us the cream of his latest thinking in a pleasant and eminently readable form. No other living naturalist has the same union of high literary excellence with profound scientific knowledge. His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The present volume, though in some respects intended as a popularisation of Mr. Wallace's previous works on the distribution of animals, yet contains an immense amount of new and important matter for the man of science, as well as much delightful reading for the less instructed public. It is, in fact, the final outcome of the author's most mature thought and research on the special subject which he has made most peculiarly his own. . . . The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

"Four years additional thought and research upon the lines laid down in that suggestive work 'The Geographical Distribution of Animals,' have brought to a conclusion the general scheme of inquiry which he from the first proposed to himself, and he now propounds, as a clear and definite theory, the results of investigations which might at first sight appear fragmentary and disconnected. Mr. Wallace has entitled himself to be called the father of the new science of zoological geography, showing that we have in the present distribution of living things over the earth's surface a key to the problems of the most ancient relations of land and water. . . . Mr. Wallace's survey of the widely-separated island system of the globe sets upon a solid basis his views of the wonderful powers of dispersion and modification existing in the organic world. . . . In his theory of local geographical changes modifying the general stability of continents we have perhaps a key to the most difficult and complex problems involved in the phenomena of the variation and distribution of living forms."—*Saturday Review.*

MACMILLAN AND CO., LONDON.

In Medium 8vo, price 18s. Vol. I.

A TREATISE ON

COMPARATIVE EMBRYOLOGY.

By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. In Two Vols. Illustrated.

"It is scarcely possible to exaggerate the expressions of gratitude which are due from zoologists to Mr. Balfour for the execution of the great task which some three or four years ago he set himself. . . . Zoologists have to be thankful to him for the admirable style in which he has carried out his work."—*Nature.*

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

NEW BOOKS ON IRELAND.

New Views on Ireland, or Irish Land Grievances and Remedies. By CHARLES RUSSELL, Q.C., M.P. Crown 8vo, cloth, 2s. 6d.

"This should be studied by every one who desires to understand the existing crisis in Ireland."—*Spectator.*

The Life's Work in Ireland of a Landlord who Tried to do his DUTY. By W. BENCE JONES of Lisselan. Crown 8vo, 6s.

"Mr. Bence Jones has written an interesting and instructive little book; but not the least enlightening part of it is the Preface, dated December 12th, 1880. He had just been threatened with Boycotting, which he now undergoes."—*St. James's Gazette.*

The Irish Land Laws. By Alexander G. Richey, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists, are called on to take part in the present controversy, the book will prove invaluable. . . . We can recommend this little book to all who speak, write, or seriously think upon this question in or out of Parliament."—*Times.*

"This book cannot fail to do good. . . . Mr. Richey writes throughout fairly, and in no partisan or controversial spirit, and his book is a contribution of great value to the discussion in which we now find ourselves involved."—*St. James's Gazette.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE'S own Works By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. 2 vols. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. Cloth elegant, gilt, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. 42s.

"One of the most beautiful and interesting books of the season..........Thus Blake, more than Thoreau, and infinitely more than Rousseau, is a shining example of a man who chose and secured a simple and sufficient measure of happiness There is no higher philosophy."—*Daily News.*

WORDSWORTH. By F. W. H. MYERS.

"Mr Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it"—*Academy.*

THE YEAR'S ART: A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE, which have occurred during the Year, together with information respecting the events of the Year 1881 Compiled by MARCUS B. HUISH, Crown 8vo. 2s 6d.

THE ABBOTT'S FARM; or, Practice with Science. By HENRY TANNER, M.R.A.C., F.C.S., Professor of the Principles of Agriculture in the Royal Agricultural College, Author of "First Principles of Agriculture." Extra fcap. 3s. 6d.

ISLAND LIFE; or, the Phenomena and Causes of Insular Faunas and Floras, including a revision and attempted solution of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. Medium 8vo, with Illustrations and Maps. 18s.

"The work throughout abounds with interest."—*Athenæum.*

"He takes his subject matter from all the sciences, and he builds it into a new harmonious whole."—*Fortnightly Review.*

GILBERT WHITE'S NATURAL HISTORY AND ANTIQUITIES OF SELBORNE. New Edition, with a Poem and Letters never before published. Edited, with Notes and Memoir, by FRANK BUCKLAND; a chapter on Antiquities by Lord SELBORNE; and the Garden Kalendar. With Illustrations by Prof DELAMOTTE. Cheap Edition Crown 8vo. 6s

PHYSICS OF THE EARTH'S CRUST. By Rev. O. FISHER, M.A., F.G.S., Rector of Harlton, &c. 8vo [*Shortly.*

STUDIES IN DEDUCTIVE LOGIC. By W. STANLEY JEVONS, LL.D., M.A., F.R.S. Crown 8vo. 6s.

"It is indispensable to the many students of the higher logic."—*Athenæum.*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments. . . It is an admirable compendium, and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

MACMILLAN & CO., LONDON.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, January 1881.

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"*To the solid ground*
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 585, Vol. 23] THURSDAY, JANUARY 13, 1881 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

ROYAL INSTITUTION OF GREAT BRITAIN,
ALBEMARLE STREET, PICCADILLY, W.
CHANGES IN THE LECTURE ARRANGEMENTS.

Prof. EDWARD A. SCHÄFER, F.R.S.—First of Eleven Lectures on The Blood, on Tuesday, January 25 (instead of Tuesday, January 18), at 3 p.m. One Guinea the Course.
FRANCIS HUEFFER, Esq.—First of Four Lectures on The Troubadours, on Thursday, January 27 (instead of Thursday, January 20), at 3 p.m. Half-a-Guinea.
SIDNEY COLVIN, Esq., Slade Professor of Fine Art, Cambridge.—First of Four Lectures on The Amazons, a Chapter in the Study of Greek Art and Mythology, on Saturday, January 29 (instead of Saturday, January 22), at 3 p.m. Half-a-Guinea.
Subscription for all the Courses in the Season, Two Guineas.
Friday, January 21st, 8 p.m.—WARREN DE LA RUE, Esq., D.C.L., F.R.S., Sec. R.I., The Phenomena of the Electric Discharge with 14,400 Chloride of Silver Cells, 9 p.m.

To the Friday Evening Meetings Members and their Friends only are admitted.

ROYAL SCHOOL OF MINES.

Dr. FRANKLAND, D.C.L., F.R.S., will commence a Course of Thirty Lectures on Organic Chemistry at the Science Schools, South Kensington, on MONDAY next, the 17th inst., at 12 at noon, to be continued on each succeeding Wednesday, Friday, and Monday at the same hour. Fee, £3; or to those who have attended the Inorganic Course, £2.

F. W. RUDLER, Registrar.

Microscopes and other Scientific Apparatus
C. BAKER,
244 & 245, HIGH HOLBORN,
Begs to call the attention of the Scientific to his Extensive Stock of Instruments at the lowest possible prices, viz.:—

ACHROMATIC MICROSCOPES: the Largest Assortment in London can be selected from, from £3 3s.
ASTRONOMICAL TELESCOPES from £5 5s.
FIELD GLASSES in Leather Sling Cases, from 20s.
OPERA GLASSES in Ivory, Leather, Metal, &c., from 12s. 6d.
GOLD SPECTACLES of every kind from 15s.
THE BEST LONDON-MADE PEBBLES IN STEEL FRAMES, 10s. 6d.
PLAIN STEEL DITTO, from 3s. 6d.
FOLDING HAND SPECTACLES IN TORTOISESHELL, STEEL, &c., from 3s. 6d.
DISSOLVING VIEW APPARATUS, complete from £6 10s.
MAGIC LANTERNS, from 6s. 6d.; Slides, all kinds, from 1s. 3d.

CATALOGUES FREE BY POST.
Second Hand Scientific Instruments.

C. BAKER'S new Catalogue of Scientific Instruments is now out; Selections can be made from a very large stock, comprising Microscopes, Astronomical Telescopes, Transit Instruments, Regulators, Spectroscopes, Meteorological and Electrical Apparatus, Dissolving Views, &c. All at the very lowest prices.

Catalogues of same Free by Post. *Instruments taken in exchange.*
Established 1765.

BROWNING'S
ASTRONOMICAL TELESCOPES.
Reduced List of Prices of these Telescopes Free.

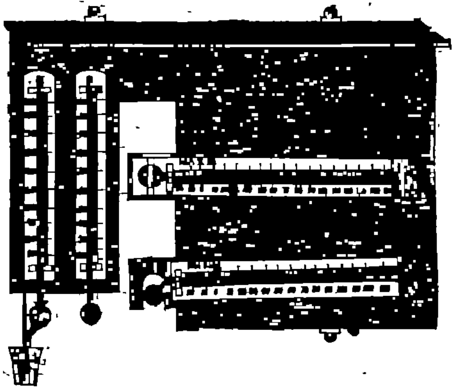
The EDUCATIONAL REFLECTING TELESCOPE, with Silvered Glass Mirror 4½ in. diameter, 5 ft. focus, Mounted on a Parallactic Stand for following the Heavenly Bodies with one Motion by means of an endless Driving-screw and Hook's Joint, with Two Eye-pieces.

PRICE £22 0s. 0d.

Powers can be used up to 400 diameters on many Stars with advantage.

JOHN BROWNING,
OPTICAL AND PHYSICAL INSTRUMENT MAKER TO H.M. GOVERNMENT.
63, STRAND, LONDON, W.C.
Microscopes, Spectroscopes, Spectacles, &c., &c.

STANDARD METEOROLOGICAL INSTRUMENTS



Now ready, a New Edition of Negretti & Zambra's Encyclopædic Catalogue of Mathematical, Philosophical, Optical, and Standard Meteorological Instruments, containing numerous Comparative Tables of Reference, and Illustrated by Twelve Hundred Engravings.
Royal 8vo, cloth, gilt lettered, price 5s. 6d.

NEGRETTI & ZAMBRA,
Opticians and Scientific Instrument Makers
To Her Majesty the Queen,
HOLBORN VIADUCT,
45, CORNHILL, & 122, REGENT STREET, LONDON.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48B, Tollington Road, Holloway, London, N.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PROFESSORSHIP OF GENERAL AND AGRICULTURAL CHEMISTRY.

This Chair will be VACANT in MAY. Gentlemen duly qualified, especially in Agricultural Chemistry and Chemico-Agricultural Work, are invited to become Candidates. Salary, £400 with one Assistant, or £300 with two, without Board and Residence. Excellent Laboratory. Facilities for Private Work. The new Professor to enter on duties May 30th. Testimonials, &c., to be forwarded to the PRINCIPAL on or before Saturday, March 5th.

KING'S COLLEGE, LONDON.

Prof. W. G. ADAMS will deliver a Course of Lectures on Voltaic Electricity and Magnetism and their Applications to Cable-testing, Electric-lighting, &c., on Thursdays, beginning THURSDAY, January 20th, at 2 p.m.

For further particulars apply to

J. W. CUNNINGHAM, Secretary.

ROYAL ASIATIC SOCIETY,

MONDAY, JANUARY 24, 1881

A Paper will be read by W. SIMPSON, Esq., F.R.G.S., "On the Identification of Nagara-hara in the Jellalabad Valley, with reference to the Travels of Hiouen-Thsang."

W. S. W. VAUX, Sec. R.A.S.

PRELIMINARY SCIENTIFIC EXAMINATION.—UNIVERSITY OF LONDON.

A Class in all the Subjects (including Practical Work) for this Examination is held at St. Bartholomew's Hospital, continuing till the Examination in July. The Class is open to Candidates who are not Students of the Hospital, as well as to Students, and will begin on TUESDAY, January 18th.

Botany—Rev. G. Henslow, M.A., Christ's Coll., Camb.; Lecturer on Botany to the Hospital.
Zoology—Norman Moore, M.D. St. Cath. Coll., Camb., Lecturer on Comparative Anatomy to the Hospital.
Chemistry—H. E. Armstrong, Ph.D., F.R.S., Demonstrator of Chemistry.
Physics—Donald McAlister, B.A., Fellow of St. John's Coll., Camb., Demonstrator of Physics.

Fee for the whole Course (including Chemicals) to Students of the Hospital, £8 8s.; to others, £10 10s.

Particulars may be ascertained on application, personally or by letter, to the WARDEN of the College, St. Bartholomew's Hospital, E.C. A Handbook forwarded on application.

UNIVERSITY OF LONDON.

PRELIMINARY SCIENTIFIC AND 1ST M.B. EXAMINATIONS.

Special Classes in all the Subjects required for these Examinations will commence at St. Thomas's Hospital Medical School early in JANUARY. Full particulars may be obtained from the Secretary, Dr. GILLESPIE.

SAINT PAUL'S SCHOOLS.—About 12 Scholarships will be awarded next Term.—For information, address CLERK TO GOVERNORS, Mercers' Hall, E.C.

CHEMICAL & PHYSICAL RESEARCH.—A Gentleman or Youth, desirous of pursuing it, may communicate with X., care of H. M. Chichester, 97, Belgrave Road, S.W.

INSTRUCTION IN MATHEMATICS.—Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers the Infusorian, *Bursaria truncatella*, with drawing and description. He has also sent out the Fairy Shrimp, *Chirocephalus diaphanus*, *Diaptomus castor*, *Asellus vulgaris*, *Stephanoceros Eichhornii*.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

MINERALOGY AND GEOLOGY.

FINE CRYSTALLISED DANBURITES, the first Specimens received in England.
MAGNIFICENT CRYSTAL of MATLOCKITE from Derbyshire.
VERY BRILLIANT and FINELY CRYSTALLISED AUGITE, from Sweden.
VERY LARGE and FINE CRYSTALS of LIBETHENITE, CHALCOSIDERITE, CUPRITE, LIROCONITE, CASSITERITE, BISMUTHINE, HENWOODITE.
COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

CHRISTMAS PRESENTS.—The Popular SCIENTIFIC POCKET CABINET SERIES. (SECOND EDITION.) 20 Specimens of Rocks, Fossils, and Minerals to illustrate Prof. Geikie's Geology Primer.

25 Minerals, Rocks, and Fossils to illustrate Bonney's Geology.

25 British Rocks. 25 British Fossils. 25 Earthy Minerals. 25 Metalliferous Minerals. 25 Metals and Alloys. 25 Recent Shells. 20 Rough Gems and Stones.

Each Collection complete in itself, price 2s. 6d.

*** The Specimens are sufficiently large for recognition of the Species, and are contained in Small Cabinets suitably adapted for carrying in the Pocket.

THOMAS J. DOWNING, Geologist, &c., 38, WHISKIN STREET, LONDON, E.C. N.B.—Post Office Order or Cheque must invariably accompany all Orders, with an additional Fourpence on each set for free delivery.

ROCK SECTIONS & ROCK SPECIMENS.

Collections of Rock Specimens to illustrate Rutley's "Study of Rocks" specially prepared. 100 Small Specimens in Cabinet, One Guinea; 200 Specimens, Two Guineas. Extensive and choice Series of Rocks for selection. New List of Sections of Rocks for Microscope, and List of Collections, &c.

JAMES R. GREGORY'S
Extensive New Museum and Show Rooms,
88, CHARLOTTE STREET, FITZROY SQUARE.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra. Ground edged Slips, 5s. per gross, also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

Sale by Auction.

BEWLEY & DRAPER (Limited), Dublin.

New publishing, in Crown 8vo. Price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold.

WORDSWORTH. By F. W. H. Myers.

LOCKE. By Prof. Fowler.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner*.

BYRON. By Prof. Nichol.

"Decidedly one of the most careful and valuable of the whole series."—*Athenæum*.

POPE. By Leslie Stephen.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette*.

COWPER. By Goldwin Smith.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News*

CHAUCER. By Prof. A. W. Ward.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy*.

BUNYAN. By J. A. Froude.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum*.

SOUTHEY. By Prof. Dowden.

"A truly scholarly and delightful monograph."—*Examiner*.

HAWTHORNE. By Henry James, Jun.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation*.

MILTON. By Mark Pattison.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator*.

JOHNSON. By Leslie Stephen.

"The new series opens well with Mr Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette*.

SCOTT. By R. H. Hutton.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner*.

GIBBON. By J. C. Morison.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner*.

SHELLEY. By J. A. Symonds.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum*.

HUME. By Prof. Huxley, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum*.

GOLDSMITH. By William Black.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings"—*Athenæum*.

DEFOE. By W. Minto.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum*.

BURNS. By Principal Shairp.

". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator*.

SPENSER. By the Very Rev. the Dean of St. Paul's.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy*.

THACKERAY. By Anthony Trollope.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum*.

BURKE. By John Morley.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review*.

*** *Others in Preparation.*

MACMILLAN AND CO., LONDON.

NATURE SERIES.

The Life's Work in Ireland of a Landlord who Tried to do his DUTY. By W. BENCE JONES of Lisselan. Crown 8vo, 6s.

"Mr. Bence Jones has written an interesting and instructive little book; but not the least enlightening part of it is the Preface, dated December 12th, 1880. He had just been threatened with Boycotting, which he now undergoes."—*St. James's Gazette.*

The Irish Land Laws. By Alexander G Richey, Q.C., LL.D., Deputy Regius Professor of Feudal and English Law in the University of Dublin. Crown 8vo. 3s. 6d.

"To all who, either as legislators or publicists, are called on to take part in the present controversy, the book will prove invaluable. . . . We can recommend this little book to all who speak, write, or seriously think upon this question in or out of Parliament."—*Times.*

"This book cannot fail to do good. . . . Mr. Richey writes throughout fairly, and in no partisan or controversial spirit, and his book is a contribution of great value to the discussion in which we now find ourselves involved."—*St. James's Gazette.*

LIFE OF WILLIAM BLAKE. With Selections from his Poems and other Writings. Illustrated from BLAKE's own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. 2 vols. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. Cloth elegant, gilt, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. 42s.

"One of the most beautiful and interesting books of the season.........Thus Blake, more than Thoreau, and infinitely more than Rousseau, is a shining example of a man who chose and secured a simple and sufficient measure of happiness There is no higher philosophy."—*Daily News.*

THE YEAR'S ART: A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE, which have occurred during the Year, together with information respecting the events of the Year 1881. Compiled by MARCUS B. HUISH, Crown 8vo. 2s. 6d.

"It is indispensable to the many students of the higher logic."—*Athenæum*

GUIDE TO THE STUDY OF POLITICAL ECONOMY. By Dr. LUIGI COSSA, Professor of Political Economy in the University of Pavia. Translated from the Second Italian Edition. With a Preface by W. STANLEY JEVONS, F.R.S. Crown 8vo. 4s. 6d.

"It would be impossible to find a more compact and better-written sketch of the history of Political Economy and its latest developments . . . It is an admirable compendium, and will, we hope, be widely circulated, as it will prove to many for the first time that the study of political economy is even more actively pursued on the Continent, than in England."—*Notes and Queries.*

Subscription for all the Courses in the Season, Two Guineas.

Friday, January 28th, 8 p.m.—Dr ARTHUR SCHUSTER, F.R.S., The Teachings of Modern Spectroscopy, 9 p.m.

To the Friday Evening Meetings Members and their Friends only are admitted.

SCIENCE CLUB, 4, SAVILE ROW, W.

—This Club is OPEN for the use of Members. Gentlemen desirous of ascertaining the Conditions of Membership should communicate with the HON. SEC. Entrance Fee Five Guineas. Annual Subscription—Town Members, Four Guineas; Country Members, Three Guineas.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro-Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As

it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

ROCK SECTIONS & ROCK SPECIMENS.

Collections of Rock Specimens to Illustrate Rutley's "Study of Rocks" specially prepared. 100 Small Specimens in Cabinet, One Guinea; 200 Specimens, Two Guineas. Extensive and choice Series of Rocks for selection. New List of Sections of Rocks for Microscope, and List of Collections, &c.

JAMES R. GREGORY'S
Extensive New Museum and Show Rooms,
88, CHARLOTTE STREET, FITZROY SQUARE.

12. Pulse Dicrotism By Wm. Jas. Fleming, M.D.
13. Anatomical Notices.

MACMILLAN & CO, London and Cambridge.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

LATEST EDITION OF GANOT'S PHYSICS.

In large crown 8vo, illustrated by 4 Coloured Plates and 844 Woodcuts, price 15s., cloth.

ELEMENTARY TREATISE on PHYSICS, Experimental and Applied, for the use of Colleges and Schools Translated and Edited, with the Author's sanction, from GANOT'S "Éléments de Physique" by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College, Sandhurst. Ninth Edition, Revised and Enlarged.

"This well-known work has been before the public for sixteen years, and has now reached a ninth edition. Each new edition has contained both additions and revisions in accordance with the progress of science. The present edition differs from the last by an increase of subject-matter of twenty-five pages, while twenty-four new illustrations have been added. The illustrations are extremely good, and the various subjects are discussed with a sufficient infusion of mathematics to make the book serviceable for the use of the highest forms in schools and for scholarship and other examinations."—*Academy.*

By the same Translator, in crown 8vo, price 7s. 6d.

GANOT'S NATURAL PHILOSOPHY for GENERAL READERS and YOUNG PERSONS. Third Edition, Revised, with a Coloured Plate and 454 Woodcuts.

London: LONGMANS & CO.

EDITED BY HENRY WATTS, B.A., F.R.S.,
Editor of the *Journal* of the Chemical Society

FOWNES' PHYSICAL and INORGANIC CHEMISTRY. Twelfth Edition, with Coloured Plate and 154 Engravings, crown 8vo. 8s. 6d.

Also,

FOWNES' CHEMISTRY OF CARBON COMPOUNDS; or, ORGANIC CHEMISTRY. Twelfth Edition, with Engravings, crown 8vo. 10s.

London: J. & A. CHURCHILL.

METALS and their CHIEF INDUSTRIAL APPLICATIONS. By C. ALDER WRIGHT, D.Sc., Lecturer on Chemistry in St. Mary's Hospital Medical School. With Illustrations.

MACMILLAN & CO., LONDON.

THE ART JOURNAL.—NEW SERIES. With the JANUARY NUMBER a NEW SERIES of the ART JOURNAL is COMMENCED, with several important Alterations and Additions.

THE ART JOURNAL.—ETCHINGS.—An Etching will be included with Every Number of the Journal during the year 1881. In January "The Babes in the Wood." By H. Herkomer, A R A. In February "An Old German Mill" By A H. Haig. In March "An Old English Mill." By Birket Foster. In April "Saved." By C. O. Murray. After C. Napier Hemy.

THE ART JOURNAL.—REPRODUCTIONS IN FAC-SIMILE.—The usual Line Engravings and Etchings will be supplemented by Reproductions in Fac-simile. The January Number contains one from the pencil of Mr. E. J. Poynter, R A, from his Picture of "Venus and Æsculapius." This will be followed by "Daphnephoria," after Sir F. Leighton, P.R.A.

Illustrated Catalogue of Electrical Apparatus, Part 1, post free, 6 Stamps. Ditto, Electric Signals, Part 2, 6 Stamps.

FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).

It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d.

THE QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE.

Edited by
E. RAY LANKESTER, M.A., F.R.S., F.L.S.,
Fellow of Exeter College, Oxford, and Professor of Zoology and Comparative Anatomy in University College, London;
With the co-operation of
F. M. BALFOUR, M.A., F.R.S., F.L.S.,
Fellow and Lecturer of Trinity College, Cambridge;
W. T. THISELTON DYER, M.A., F.R.S., F.L.S.,
Assistant Director of the Royal Gardens, Kew; and
E. KLEIN, M.D., F.R.S.,
Lecturer on Histology in St. Bartholomew's Hospital Medical School, London.

MEMOIRS.

Notes on a Peculiar Form of Polyzoa closely allied to Bugula (*Kinetoskias*, Kor. and Dan.) By GEORGE BUSK, F.R.S. (With Two Plates.)

On the Germination and Histology of the Seedling of Welwitschia mirabilis. By F. ORPEN BOWER, B.A., Camb. (With Two Plates.)

Notes on some of the Reticularian Rhizopoda of the "Challenger" Expedition. By HENRY B. BRADY, F.R.S.

On the Head Cavities and Associated Nerves of Elasmobranchs. By A. MILNES MARSHALL, D.Sc., M.A., Fellow of St. John's College, Cambridge, Professor of Zoology in Owen's College. (With Two Plates.)

Contributions to the Minute Anatomy of the Nasal Mucous Membrane. By E. KLEIN, M.D., F.R.S., Lecturer on Histology and Embryology in the Medical School of St. Bartholomew's Hospital. (With Plate.)

Histological Notes. By E. KLEIN, M.D., F.R.S., Lecturer on Histology and Embryology in the Medical School of St. Bartholomew's Hospital.

On the Intra-Cellular Digestion and Endoderm of Limnocodium. By E. RAY LANKESTER, M.A., F.R.S. (With Three Plates.)

On the Micrometric Numeration of the Blood-Corpuscles and the Estimation of their Hæmoglobin. By MRS. ERNEST HART.

Preliminary Account of the Development of the Lampreys. By W. B. SCOTT, M.A., Assistant in Palæontology, Princeton.

On Some Appearances of the Red Blood-corpuscles of Man and other Vertebrata. By G. F. DOWDESWELL, B.A., Cantab., F.C.S., F.L.S.

NOTES AND MEMORANDA.

Medusæ and Hydroid Polyps living in Fresh Water.

Terminology of Reproductive Organs and Classification of Thallophytes.

J. & A. CHURCHILL, New Burlington Street.

Sixth Edition, in Two vols., 8vo, £2 2s.

COOLEY'S CYCLOPÆDIA OF

PRACTICAL RECEIPTS and Collateral Information in the Arts, Manufactures, Professions, and Trades, including Medicine, Pharmacy, Hygiene, and Domestic Economy; designed as a Comprehensive Supplement to the Pharmacopœia and General Book of Reference for the Manufacturer, Tradesman, Amateur, and Heads of Families. Edited by Prof. Tuson, F.C.S., assisted by several Scientific Contributors.

This Edition exceeds the last by some 600 pages, and contains a greatly-increased number of receipts culled from the most reliable English and foreign journals; numerous articles on Applied Chemistry, Pharmacy, Hygiene, Human and Veterinary Medicine, &c., have been added; many of the old articles are extended, and, where desirable, the text is illustrated by woodcuts.

"We cannot spare space to enumerate all the improvements. Those who have the old edition of this work will do well to supply themselves with its successor; those who have no copy of it will do still better if they purchase this edition."—*Chemist and Druggist.*

"It is a storehouse of scientific knowledge, and will be found valuable in every house."—*Lancet.*

*** *This Work can also be had in 16 Parts, at 2s. 6d. each.*

J. & A. CHURCHILL, New Burlington Street.

Third Edition, Revised and Enlarged, with Forty-eight Engravings, Post 8vo. 7s. 6d.

PRACTICAL AND ANALYTICAL

CHEMISTRY, Specially adapted for Schools and Colleges, and for Beginners. By FRANK CLOWES, D.Sc., Senior Science Master at the High School, Newcastle-under-Lyme.

J. & A. CHURCHILL, New Burlington Street.

Fourth Edition, with nearly Three Hundred Engravings, 8vo. 16s.

CHEMISTRY, INORGANIC AND

ORGANIC. WITH EXPERIMENTS. By CHARLES L. BLOXAM, Professor of Chemistry in King's College, London.

By the SAME AUTHOR. Fourth Edition, with 89 Engravings, crown 8vo 5s. 6d.

LABORATORY TEACHING; or, Progressive

Exercises in Practical Chemistry.

J. & A. CHURCHILL, New Burlington Street.

Fifth Edition, 8vo, with Engravings. 7s. 6d.

VALENTIN'S QUALITATIVE CHEMICAL ANALYSIS.

Revised and Corrected by W. R. HODGKINSON, Ph.D., Demonstrator of Practical Chemistry in the Science Schools, South Kensington.

J. & A. CHURCHILL, New Burlington Street.

Eighty-eighth Thousand. Fcap 8vo. 2s. 6d.

ADVICE TO A MOTHER ON THE

MANAGEMENT OF HER CHILDREN, and on the Treatment on the Moment of some of their more pressing Illnesses and Accidents. By PYE-CHAVASSE, F.R.C.S. With Notes and Annotations by Sir C. LOCOCK, Bart., M.D., F.R.S.

By the SAME AUTHOR. One Hundredth Thousand. Fcap 8vo 2s. 6d.

ADVICE TO A WIFE ON THE MAN-

AGEMENT of her own HEALTH, and on the Treatment of some of the Complaints incidental to Pregnancy, Labour, and Suckling. With an Introductory Chapter especially addressed to a Young Wife.

J. & A. CHURCHILL, New Burlington Street.

"The value of such information as is contained in this book, both to teachers and learners, can scarcely be overrated."—*Nature.*

Second Edition, Revised and Enlarged, Crown 8vo. With Engravings 6s. 6d.

PHYSIOLOGY AND HYGIENE OF THE

VOICE, with especial reference to its Cultivation and Preservation, for the Use of Speakers and Singers. By GORDON HOLMES, L.R.C.P.E., Physician to the Municipal Throat and Ear Infirmary.

"Will prove most valuable. . . . In a truly scientific spirit."—*Athenæum.* "Admirably given."—*Nature.* "Well written."—*Lancet.* "Of great excellence."—*Dublin Medical Journal.* "Marked with sound sense."—*Saturday Review.* "A valuable book."—*Western Review.* "Much more clear and satisfactory than ordinary books of physiology."—*New York Medical Journal.* "Both classes will derive great benefit from studying it and following its precepts."—*Philadelphia Medical Times.*

J. & A. CHURCHILL, New Burlington Street.

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

SCIENCE and ART DEPARTMENT OF THE COMMITTEE OF COUNCIL ON EDUCATION.

EXAMINATIONS IN DRAWING IN ELEMENTARY DAY SCHOOLS.

The Science and Art Department will hold EXAMINATIONS in ELEMENTARY DRAWING through the agency of the Managers in Elementary Day Schools throughout the Kingdom.

These Examinations will take place on MONDAY, March 7th, in Elementary Schools at which Drawing is taught by persons certificated in Second Grade Drawing. Payments to the Managers and Prizes to the Children and Pupil Teachers are offered on the results of those Examinations.

Applications for Examination must be made before February 1st to the Secretary, Science and Art Department, London, S.W.

By Order of

THE COMMITTEE OF COUNCIL ON EDUCATION.

QUEENWOOD COLLEGE, near STOCKBRIDGE, HANTS. A High-Class School for Boys. The course of study is adapted to the pupils' requirements For view of the College see *Graphic* of December 25th, 1880. The Spring Term begins Friday, January 21st. Applications to the Principal, C. Willmore.

INSTRUCTION IN MATHEMATICS.—Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

Microscopes and other Scientific Apparatus

C. BAKER,

244 & 245, HIGH HOLBORN,

Begs to call the attention of the Scientific to his Extensive Stock of Instruments at the lowest possible prices, viz :—

ACHROMATIC MICROSCOPES: the Largest Assortment in London can be selected from, from £3 3s.
ASTRONOMICAL TELESCOPES from £5 5s.
FIELD GLASSES in Leather Sling Cases, from 20s.
OPERA GLASSES in Ivory, Leather, Metal, &c., from 12s. 6d.
GOLD SPECTACLES of every kind from 15s
THE BEST LONDON-MADE PEBBLES IN STEEL FRAMES, 10s. 6d
PLAIN STEEL DITTO, from 3s. 6d.
FOLDING HAND SPECTACLES IN TORTOISESHELL, STEEL, &c., from 3s. 6d
DISSOLVING VIEW APPARATUS, complete from £6 10s.
MAGIC LANTERNS, from 6s 6d ; Slides, all kinds, from 1s 3d.

CATALOGUES FREE BY POST.

Second Hand Scientific Instruments.

C. BAKER'S new Catalogue of Scientific Instruments is now out; Selections can be made from a very large stock, comprising Microscopes, Astronomical Telescopes, Transit Instruments, Regulators, Spectroscopes, Meteorological and Electrical Apparatus, Dissolving Views, &c. All at the very lowest prices.

Catalogues of same Free by Post. *Instruments taken in Exchange.*
Established 1765.

BROWNING'S SPECTROSCOPES.

THE MINIATURE SPECTROSCOPE.

This Instrument will show many of Fraunhofer's lines, the bright lines of the metals and gases, and the absorption bands in coloured gases, crystals, or liquids.

Price, with Plain Slit, £1 2s.; ditto, with Adjustable Slit in Morocco Case, £1 15s.; ditto, with Achromatic Lenses, &c., &c., in Morocco Case, £2 6s.

An Illustrated Catalogue of Spectroscopes, Price Sixpence.

List of Spectroscopes sent free.

JOHN BROWNING,

63, STRAND, LONDON, W.C.

STANDARD METEOROLOGICAL INSTRUMENTS

Now ready, a New Edition of Negretti & Zambra's Encyclopædic Catalogue of Mathematical, Philosophical, Optical, and Standard Meteorological Instruments, containing numerous Comparative Tables of Reference, and Illustrated by Twelve Hundred Engravings.
Royal 8vo, cloth, gilt lettered, price 5s 6d.

NEGRETTI & ZAMBRA,

Opticians and Scientific Instrument Makers

To Her Majesty the Queen,

HOLBORN VIADUCT,

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro-Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	...	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	...	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	...	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	...	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

GEOLOGY AND MINERALOGY.

Special Collections for Teachers and Students, used with success by all Lecturers and Teachers of Geology in Great Britain. Obtained Gold and Bronze Medals at Sydney Exhibition, 1879, also in London, 1862, and Paris, 1867.

200 Specimens	in Cabinet	...	£2	2	0
100 ditto	ditto	...	1	1	0
50 ditto	ditto	...	0	10	6

New Lists of Collections, Apparatus, &c., now ready, and free on application to

JAMES R. GREGORY'S
Geological Museum and Repository,
88, CHARLOTTE STREET, FITZROY SQUARE.

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price 7s. 6d.

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful Lens, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust.—THOMAS J. DOWNING, GEOLOGIST, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers *Spirorbis nautiloides*, with drawing and description. He has also sent out *Follicularia ampulla*, *Argulus foliaceus*, *Asellus vulgaris*, young American Trout, *Salmo fontinalis*, *Cordylophora lacustris*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

FERD. DUMMLER'S VERLAGSBUCHHANDLUNG.
(Harrwitz & Gossmann.)

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by C. G. BARRETT, J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., E. SAUNDERS, F.L.S., and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to VI. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liége, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter.

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription: Twenty-five Shillings, or Twenty-seven Shillings post free.

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London.

In the first two numbers have appeared:—

VAN BENEDEN: On the Embryology of the Mammalia.
VAN BAMBEKE: On the Cleavage of the Egg in Batrachia.
FOETTINGER: On the Termination of Nerves in the Muscles of Insects.
FREDERICQ AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.
MACLEOD: On the Harderian Gland of the Duck, &c., &c.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish, new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 22, Arundel Street, Strand, London, W.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh.

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

Now ready, Price 6s., Part II., Vol. XV., January, 1881.

THE JOURNAL OF ANATOMY AND PHYSIOLOGY, NORMAL AND PATHOLOGICAL.

CONDUCTED BY

Profs. HUMPHRY, TURNER, M'KENDRICK, & Dr. CREIGHTON.

Contents.

1. Bones, Articulations, and Muscles of Rudimentary Hind-limb of Greenland Right-Whale. By J. Struthers, M.D. (Plates XIV.–XVII.)
2. Infective Form of Tuberculosis in Man identical with Bovine Tuberculosis. By C. Creighton, M.D.
3. Medullary Neuroma of Brain. By W. Osler, M.D. (Plate XVIII.)
4. Dissection of Genito-Urinary Organs in Case of Fissure of Abdominal Walls. By A. Doran, F.R.C.S. (Plate XIX.)
5. Description of a Polygraph (with Figure). By D. Newman, M.B.
6. Remarks on Mechanism of Secretion of Sweat. By C. Handfield Jones, M.B.
7. Anomalous Growth-Bearing Pilose Skin in Pharynx of a Young Woman. By P. S. Abraham, M.A. (With Figure.)
8. Histology of Granular Kidney (with Figure). By R. Saundby, M.D.

10. Colouring Matter of Jelly Fishes. By Prof. M'Kendrick.
11. Nerves of the Hind-Limb of the Thylacine and Cuscus. By D. J. Cunningham, M.D.
12. Pulse Dicrotism. By Wm. Jas. Fleming, M.D.
13. Anatomical Notices.

MACMILLAN & CO., London and Cambridge.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Français pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d.; six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

MANUALS FOR STUDENTS.

FLOWER (W. H.)—AN INTRODUCTION TO THE OSTEOLOGY OF THE MAMMALIA. Being the Substance of the Course of Lectures delivered at the Royal College of Surgeons of England in 1870. By W. H. FLOWER, F.R.S., F.R.C.S., Hunterian Professor of Comparative Anatomy and Physiology. With numerous Illustrations. Second Edition enlarged. Crown 8vo. 10s. 6d.

FOSTER and BALFOUR—THE ELEMENTS OF EMBRYOLOGY. By MICHAEL FOSTER, M.D., F.R.S., and F. M. BALFOUR, M.A. Part I. Crown 8vo. 7s. 6d.

FOSTER and LANGLEY—A COURSE OF ELEMENTARY PRACTICAL PHYSIOLOGY. By MICHAEL FOSTER, M.D., F.R.S., and J. N. LANGLEY, B.A. Fourth Edition. Crown 8vo. 6s.

HOOKER (Dr.)—THE STUDENT'S FLORA OF THE BRITISH ISLANDS. By Sir J. D. HOOKER, K.C.S.I., C.B., P.R.S., M.D., D.C.L. Second Edition, Revised. Globe 8vo. 10s. 6d.

"Cannot fail to perfectly fulfil the purpose for which it is intended."—*Land and Water.*

"Certainly the fullest and most accurate manual of the kind that has yet appeared."—*Pall Mall Gazette.*

HUXLEY and MARTIN—A COURSE OF PRACTICAL INSTRUCTION IN ELEMENTARY BIOLOGY. By Professor HUXLEY, F.R.S., assisted by H. N. MARTIN, M.B., D.Sc. New Edition, revised. Crown 8vo. 6s.

"It is impossible for an intelligent youth, with this book in his hand, placing himself before any one of the organisms described, and carefully following the directions given, to fail to verify each point to which his attention is directed."—*Athenæum.*

HUXLEY—PHYSIOGRAPHY. An Introduction to the Study of Nature. By Professor HUXLEY, F.R.S. With numerous Illustrations, and Coloured Plates. New and Cheaper Edition. Crown 8vo. 6s.

OLIVER (Professor)—FIRST BOOK OF INDIAN BOTANY. By DANIEL OLIVER, F.R.S., F.L.S., Keeper of the Herbarium and Library of the Royal Gardens, Kew, and Professor of Botany in University College, London. With numerous Illustrations. Extra fcap. 8vo. 6s. 6d.

"It contains a well-digested summary of all essential knowledge pertaining to Indian Botany, wrought out in accordance with the best principles of scientific arrangement."—*Allen's Indian Mail.*

PARKER and BETTANY—THE MORPHOLOGY OF THE SKULL. By Professor PARKER and G. T. BETTANY. Illustrated. Crown 8vo. 10s.

Other Volumes of these Manuals will follow.

MACMILLAN AND CO., LONDON.

Now publishing, in Crown 8vo. Price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold.

WORDSWORTH. By F. W. H. MYERS.
"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.
"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof NICHOL.
"Decidedly one of the most careful and valuable of the whole series"—*Athenæum.*

POPE. By LESLIE STEPHEN.
"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken"—*St. James's Gazette.*

COWPER By GOLDWIN SMITH.
"Mr Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man"—*Daily News.*

CHAUCER. By Prof. A. W. WARD.
"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.
"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.
"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.
"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.
"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.
"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better; and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.
"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.
"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.
"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.
"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.
"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings"—*Athenæum.*

DEFOE. By W. MINTO.
"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.
". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.
"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.
"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.
"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

*** *Others in Preparation.*

MACMILLAN AND CO., LONDON.

Now ready, post quarto, cloth gilt, 272 pages. Price 16s.

LIGHTNING CONDUCTORS:
THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

QUESTIONS ON HUXLEY'S PHYSIOLOGY FOR SCHOOLS. By T. ALCOCK, M.D. 18mo. 1*s*. 6*d*.

BOTANY.

LESSONS IN ELEMENTARY BOTANY. By D. OLIVER, F.R.S., F.L.S., Professor of Botany in University College, London. With nearly Two Hundred Illustrations. New Edition. 18mo. 4*s*. 6*d*.

CHEMISTRY.

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By HENRY E. ROSCOE, F.R.S., Professor of Chemistry in the Victoria University, the Owens College, Manchester. With numerous Illustrations and Chromo-Litho of the Solar Spectrum, and of the Alkalies and Alkaline Earths. New Edition. 18mo. 4*s*. 6*d*.

"We unhesitatingly pronounce it the best of all our elementary treatises on Chemistry."—*Medical Times*.

A SERIES OF CHEMICAL PROBLEMS, prepared with Special Reference to the above, by T. E. THORPE, Ph.D., Professor of Chemistry in the Yorkshire College of Science, Leeds. Adapted for the preparation of Students for the Government, Science, and Society of Arts Examinations. With a Preface by Professor ROSCOE, F.R.S. New Edition, with Key, 18mo. 2*s*.

QUESTIONS ON: A Series of Problems and Exercises in Inorganic and Organic Chemistry. By F. JONES, F.R.S.E., F.C.S. Fcap. 8vo. 3*s*.

GEOGRAPHY.

CLASS-BOOK OF GEOGRAPHY. By C. B. CLARKE, M.A., F.G.S. New Edition, with eighteen coloured Maps. Fcap, 8vo. 3*s*.

"Contains a large amount of information, systematically arranged."—*Examiner*.

A SHORT GEOGRAPHY OF THE BRITISH ISLANDS. By JOHN RICHARD GREEN, M.A., LL.D., and ALICE STOPFORD GREEN. With Maps. Fcap. 8vo 3*s*. 6*d*.

"The little work may be read with pleasure and profit by any one."—*Times*.

LOGIC.

ELEMENTARY LESSONS IN LOGIC; Deductive and Inductive, with copious Questions and Examples, and a Vocabulary of Logical Terms. By W. STANLEY JEVONS, M.A., LL.D., F.R.S. New Edition. 18mo. 3*s*. 6*d*.

"A manual alike simple, interesting, and scientific."—*Athenæum*.

PHYSICS.

LESSONS IN ELEMENTARY PHYSICS. By BALFOUR STEWART, F.R.S., Professor of Natural Philosophy in the Victoria University, the Owens College, Manchester. With numerous Illustrations and Chromo-Litho of the Spectra of the Sun, Stars, and Nebulæ. New Edition. 18mo. 4*s*. 6*d*.

"The beau-ideal of a scientific text-book, clear, accurate, and thorough."—*Educational Times*.

PRACTICAL CHEMISTRY.

THE OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By FRANCIS JONES, F.R.S.E., F.C.S., Chemical Master in the Grammar School, Manchester. With Preface by Professor ROSCOE, F.R.S., and Illustrations. New Edition. 18mo. 2*s*. 6*d*.

ANATOMY.

LESSONS IN ELEMENTARY ANATOMY. By ST. GEORGE MIVART, F.R.S., Lecturer in Comparative Anatomy at St. Mary's Hospital. With upwards of 400 Illustrations. 18mo. 6*s*. 6*d*.

"The work is excellent, and should be in the hands of every student of human anatomy."—*Medical Times*.

STEAM.

AN ELEMENTARY TREATISE. By JOHN PERRY, B.E., Whitworth Scholar, &c., late Lecturer in Physics at Clifton College. With numerous Woodcuts and Numerical Examples and Exercises. 18mo. 4*s*. 6*d*.

"The young engineer and those seeking for a comprehensive knowledge of the use, power, and economy of steam, could not have a more useful work, as it is very intelligible, well arranged, and practical throughout."—*Ironmonger*.

SOUND.

ELEMENTARY LESSONS ON. By Dr. W. H. STONE. With Illustrations. Fcap. 8vo. 3*s*. 6*d*.

"This is an excellent little text-book. . . . The student of acoustics will find it a very acceptable help."—*English Mechanic*.

PHYSICAL GEOGRAPHY.

ELEMENTARY LESSONS IN PHYSICAL GEOGRAPHY. By A. GEIKIE, F.R.S., Murchison Professor of Geology, &c., Edinburgh. With numerous Illustrations. 18mo. 4*s*. 6*d*.

QUESTIONS ON THE SAME. 1*s*. 6*d*.

NATURAL PHILOSOPHY.

NATURAL PHILOSOPHY FOR BEGINNERS. By I. TODHUNTER, M.A., F.R.S. Part I. The Properties of Solid and Fluid Bodies. 18mo. 3*s*. 6*d*.

Part II. Sound, Light, and Heat. 18mo. 3*s*. 6*d*.

POLITICAL ECONOMY.

POLITICAL ECONOMY FOR BEGINNERS. By MILLICENT G. FAWCETT. New Edition. 18mo. 2*s*. 6*d*.

"The relations of capital and labour have never been more simply or more clearly expounded."—*Contemporary Review*.

ECONOMICS OF INDUSTRY. By A. MARSHALL and A. P. MARSHALL. Fcap. 8vo. 2*s*. 6*d*.

"The book is of sterling value, and will be of great use to teachers and students of Political Economy."—*Athenæum*.

MACMILLAN AND CO., LONDON.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

NEW BOOKS ON IRELAND.

Disturbed Ireland, being the Letters Written during the Winter of 1880-81. By BERNARD H. BECKER, Special Commissioner of the *Daily News*. With Route Maps. Crown 8vo. 6*s.*

"Will be found one of the most trustworthy pictures of the sister island as it is . . . It has, especially at this moment, high political value."—*Examiner.*

The Life's Work in Ireland of a Landlord who Tried to do his Duty. By W. BENCE JONES of Lisselan. Crown 8vo. 6*s.*

"Mr. Bence Jones has written an interesting and instructive little book; but not the least enlightening part of it is the Preface, dated December 12th, 1880. He had just been threatened with Boycotting, which he now undergoes."—*St. James's Gazette.*

Life of William Blake: With Selections from his Poems and other Writings. Illustrated from BLAKE'S own Works. By ALEXANDER GILCHRIST. A New and Enlarged Edition, with Additional Letters and a Memoir of the Author. 2 vols. Printed on hand-made paper, the Illustrations on India paper, and mounted in the text. Cloth elegant, gilt, with designs after BLAKE by FREDK. J. SHIELDS. Medium 8vo. 42*s.*

"One of the most beautiful and interesting books of the season."—*Daily News.*

"Without any reservation, it is undoubtedly one of the most tasteful and thorough editions of a fine art book which we ever remember to have seen."—*Notes and Queries.*

The Steam Engine and its Inventors. A Historical Sketch. By Robert L. GALLOWAY, Mining Engineer. With numerous Illustrations. Crown 8vo. 10*s.* 6*d.*

The Year's Art: A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE, which have occurred during the Year, together with information respecting the events of the Year 1881. Compiled by MARCUS B. HUISH. Crown 8vo. 2*s.* 6*d.*

GOLDEN TREASURY SERIES.—NEW VOLUME.

Essays of Joseph Addison. Chosen and Edited by John Richard Green, M.A., LL.D. 18mo. 4*s.* 6*d.*

"This is a most welcome addition to a most excellent series."—*Examiner.*

Dictionary of Music and Musicians (A.D. 1450—1878). *By Eminent* Writers, English and Foreign. Edited by GEORGE GROVE, D.C.L. Three Vols. 8vo, with Illustrations and Woodcuts. Parts I. to XII. each 3*s.* 6*d.* Vols. I. and II., 8vo, cloth, each 21*s.*

Vol. I. A to Impromptu. Vol. II. Improperia to Plain Song.

"This work promises to be for music what the best encyclopædias are to general literature and science."—*Guardian.*

English Poets: Selections, with Critical Introductions by various Writers, and a General Introduction by MATTHEW ARNOLD. Edited by T. H. WARD, M.A. 4 vols., crown 8vo, each 7*s.* 6*d.*

Vol. I. CHAUCER to DONNE.
Vol. II. BEN JONSON to DRYDEN.
Vol. III. ADDISON to BLAKE.
Vol. IV. WORDSWORTH to SYDNEY DOBELL.

"An excellent design admirably executed"—*Pall Mall Gazette.*

English Men of Letters. Edited by John Morley. Crown 8vo. 2s. 6d.

(New Volume.)

WORDSWORTH. By F. W. H. MYERS.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

The Abbott's Farm; or, Practice with Science. By Henry Tanner, M.R.A.C., F.C.S., Professor of the Principles of Agriculture in the Royal Agricultural College, Author of "First Principles of Agriculture." Extra fcap. 3*s.* 6*d.*

Kamilaroi and Kurnai. Group-Marriage and Relationship, and Marriage by Elopement. Drawn chiefly from the usage of the Australian Aborigines: also the Kurnai tribe—their Customs in Peace and War. By LORIMER FISON, M.A., and A. W. HOWITT, F.G.S. With an Introduction by LEWIS H. MORGAN, LL.D., Author of "System of Consanguinity," "Ancient Society," &c. Demy 8vo. 15*s.*

Gilbert White's Natural History and Antiquities of Selborne. New Edition, with a Poem and Letters never before published. Edited, with Notes and Memoir by FRANK BUCKLAND; a Chapter on Antiquities by Lord SELBORNE; and the Garden Kalendar. With Illustrations by Prof. DELAMOTTE. Cheap Edition. Crown 8vo. 6*s.*

Physics of the Earth's Crust. By Rev. O. Fisher, M.A., F.G.S., Rector of Harlton, &c. 8vo. [*Shortly.*

MACMILLAN AND CO., LONDON.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"*To the solid ground*
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 588, Vol. 23] THURSDAY, FEBRUARY 3, 1881 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

UNIVERSITY OF LONDON MATRICULATION, JUNE, 1881.

Special Classes for this Examination will be formed at St Thomas's Hospital Medical School, Albert Embankment, to commence on March 1st. The Special Classes for the Preliminary Scientific and 1st M.B. Examinations have now commenced. Full particulars can be obtained from the Secretary, Dr Gillespie.

KING'S COLLEGE, LONDON.

The Office of the CURATOR of the ANATOMICAL MUSEUM is now VACANT.

Applications, accompanied by Testimonials of special aptitude for, and experience in, Museum work, to be sent to J. W. Cunningham, Esq., from whom also further information may be obtained.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AGRICULTURAL EDUCATION.

The Examination of Candidates for the Society's Prizes and Certificates, including the Life Membership of the Society, will take place in the week commencing TUESDAY, May 10th, 1881.

Copies of the Form of Entry, which is required to be sent in by April 1, 1881, may be had on application to

H. M. JENKINS, Secretary.

12, Hanover Square, London, W.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O P, Post Office, Turnham Green.

Second-Hand Astronomical Telescopes,
Microscopes, & other Scientific Instruments.

C. BAKER,

244 & 245, HIGH HOLBORN,

Begs to call the attention of the Scientific to his Large and Extensive Stock of

ASTRONOMICAL TELESCOPES,
MICROSCOPES,
TRANSIT INSTRUMENTS,
REGULATORS, SPECTROSCOPES,
METEOROLOGICAL AND ELECTRIC APPARATUS,

By ROSS, DALLMEYER, COOKE, SMITH & BECK, BROWNING, DENT, TROUGHTON,

And other Celebrated Makers. All at very Low Prices.

CATALOGUE FREE BY POST.

INSTRUMENTS TAKEN IN EXCHANGE.

Established 1765

BROWNING'S SPECTROSCOPES.

THE MINIATURE SPECTROSCOPE.

This Instrument will show many of Fraunhofer's lines, the bright lines of the metals and gases, and the absorption bands in coloured gases, crystals, or liquids.

Price, with Plain Slit, £1 2s.; ditto, with Adjustable Slit in Morocco Case, £1 15s.; ditto, with Achromatic Lenses, &c., &c., in Morocco Case, £2 6s.

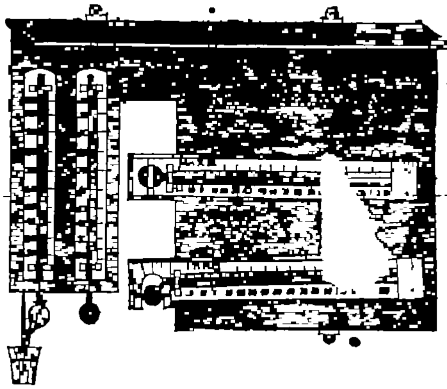
An Illustrated Catalogue of Spectroscopes, Price Sixpence.

List of Spectroscopes sent free.

JOHN BROWNING,

63, STRAND, LONDON, W.C.

STANDARD METEOROLOGICAL INSTRUMENTS



Now ready, a New Edition of Negretti & Zambra's Encyclopædic Catalogue of Mathematical, Philosophical, Optical, and Standard Meteorological Instruments, containing numerous Comparative Tables of Reference, and Illustrated by Twelve Hundred Engravings.

Royal 8vo, cloth, gilt lettered, price 5s 6d.

NEGRETTI & ZAMBRA,

Opticians and Scientific Instrument Makers

To Her Majesty the Queen,

HOLBORN VIADUCT,

INSTITUTE OF CHEMISTRY.

PRIZES.

DR. FRANKLAND has offered a Prize of £50 for the best Original Investigation involving Gas Analysis, and DR. C. MEYMOTT TIDY has also offered a Prize of £25 for the best Original Investigation on Special Reactions of the Alkaloids and their Separation from Organic Mixtures. These prizes will be open to Associates, and to all persons (except Fellows of the Institute) who shall, before the 31st of December next, have qualified for the Associateship in all respects, short of passing the prescribed practical examination; and successful competition for these prizes will be accepted in lieu of such practical examination.

Further information may be obtained on application to the Secretary, Mr C. E. GROVES, Somerset House Terrace, W.C.

FOR SALE, price £100.—A rapidly-growing ANALYTICAL PRACTICE in the West of England. To be sold because the owner is leaving England.—Apply by letter, G. W. R., 52, Drury Lane, London, E.C.

ROYAL POLYTECHNIC.—CLASSES for the Preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

MINERALOGY AND GEOLOGY.

Mr. HENSON having purchased an OLD COLLECTION formed in DERBYSHIRE, containing FINE SPECIMENS of ANGLESITE, CERUSSITE, FLUOR SPAR and CALC SPAR, DIOPTASE, EUCHROITE, and other RARE MINERALS, begs to offer the same singly or otherwise.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro-Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

"NATURE," Nov. 14, 1878, No. 472.—One Shilling each will be paid for Copies of this number.—Address Publishers of NATURE, 29, Bedford Street, Strand, W.C.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers the Entomostracan, *Argulus foliaceus*, usually found parasitic on fish, and attached thereto as Commensals, a number of Infusoria, *Epistylis invaginata* of Claparède and Lachman. He has also sent out Hydra, Cordylophora, Rotifers, &c., also the large Edible Frog, *Rana esculenta*, suitable for dissection.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price 7s. 6d.

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful Lens, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust.—THOMAS J. DOWNING, GEOLOGIST, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by C. G. BARRETT, J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., E. SAUNDERS, F.L.S., and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to VI. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row

N.B.—Communications, &c., should be sent to the Editors at the above address.

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,

With the Assistance of

FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious, or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh.

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

FREEDEN, M.R., Hamburg, Alexander Street, 8.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 16s. 6d. per annum, post free, dating from any quarter-day. Single Copies 1s. each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

Just published.

MANUAL OF ELEMENTARY SCIENCE—ELECTRICITY.

By PROFESSOR FLEEMING JENKIN, F.R.S.

With numerous Illustrations. Fcap. 8vo, limp cloth, 1*s.*

NATURAL HISTORY OF BRITISH FISHES: their Structure, Economic Uses, and Capture by Net and Rod. Cultivation of Fish-Ponds, Fish suited for Acclimatisation, Artificial Breeding of Salmon. By the late FRANK BUCKLAND, H.M. Inspector of Fisheries, &c. With numerous Woodcuts. Crown 8vo, cloth boards, 5*s.*

NATURAL HISTORY RAMBLES:

A Series of Popular Handbooks of the Fauna and Flora of the British Isles.

Fcap. 8vo, cloth boards. 2*s.* 6*d.* each.

IN SEARCH OF MINERALS. By the late D. T. ANSTED, M.A., F.R.S., formerly Fellow of Jesus College, Cambridge, &c. With numerous Woodcuts.

"It is probable that his interesting chapters will induce many to go 'in search of minerals' for themselves."—*Athenæum.*

PONDS AND DITCHES. By M. C. COOKE, M.A., LL.D., Author of "The Woodlands." With numerous Woodcuts.

THE WOODLANDS. By M. C. COOKE, M.A., LL.D. With numerous Woodcuts.

LAKES AND RIVERS. By C. O. GROOM NAPIER, F.G.S. With numerous Woodcuts

LANE AND FIELD. By the Rev. J. G. WOOD, M.A. With numerous Woodcuts.

MOUNTAIN AND MOOR. By J. E. TAYLOR, Esq., F.L.S., F.G.S. With numerous Woodcuts.

THE SEASHORE. By Prof. P. MARTIN DUNCAN, M.B. (London), F.R.S. With numerous Woodcuts.

UNDERGROUND. By J. E. TAYLOR, Esq. F.L.S., F.G.S. With numerous Woodcuts

"With one or more of these little manuals in hand, a sojourn in the country may be made a time of unceasing delight and instruction."—*Saturday Review.*

"These handy little volumes are well put together, and seem to us decidedly superior to works of a similar kind with which we used to be familiar in our youth."—*Nature.*

LONDON: NORTHUMBERLAND AVENUE, CHARING CROSS, S.W.; 43, QUEEN VICTORIA STREET, E.C.;
and 48, PICCADILLY, W.

With Illustrations and Maps, medium 8vo, 18*s.*

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific problems of our time."—*Times.*

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

MACMILLAN AND CO., LONDON.

This Day, 80 pp., 8vo, sewed, 1*s.*

DEEP-SEA EXPLORATION. A Lecture by J. GWYN JEFFREYS, LL.D., F.R.S.

By the same Author.

BRITISH CONCHOLOGY: An Account of the Mollusca which now Inhabit the British Isles and the Surrounding Seas. Five vols., with Plain Illustrations, £4; or Coloured, £5 5*s.*

FRIDAY, FEBRUARY 11.

ROYAL ASTRONOMICAL SOCIETY, at 3.—Anniversary.

ROYAL INSTITUTION, at 9.—Distances of the Stars: Prof. R. S. Ball.

QUEKETT MICROSCOPICAL CLUB, at 8.

SOCIETY OF ARTS, at 8.—The Gold-Fields of India: Hyde Clarke.

SATURDAY, FEBRUARY 12.

ROYAL INSTITUTION, at 3.—The Amazons: Prof. Colvin.

PHYSICAL SOCIETY, at 3.—Annual General Meeting.—Special General Meeting.—On a Hydrostatic Illustration of Electrical Phenomena, and other Lecture Experiments: Dr. O. J. Lodge.

£5 5s. ASTRONOMICAL TELESCOPE.

CRAMPTON & CO.'S IMPROVED TELESCOPE is of the highest workmanship and finish, combined with great power and clearness of definition; is entirely constructed of polished brass, with 3-inch Achromatic Object Lens, Altitude and Azimuth Movements, Rackwork, and Fine Adjustment, &c., &c.

THOMAS CRAMPTON & CO., 251, HIGH HOLBORN, LONDON, W.C.

Liberal Terms to Science Teachers and the Trade.

THOMAS CRAMPTON (formerly of 4, Little Britain, London, E.C.), ELECTRICIANS, OPTICIANS, and PHILOSOPHICAL INSTRUMENT MAKERS. Electric Bells, New Metallic Base Pattern, Constant Batteries, Indicators, Thief and Fire Alarms, and Automatic Switches, Induction and Medical Coils, or Specialities. Insulated Wires of every description. Microscopic and Optical Materials. Telescopes, Opera Glasses, Microscopes, Aneroid Barometers, and Lime-light Apparatus. Illustrated Catalogue Three Stamps.

THOMAS CRAMPTON & CO., 251, HIGH HOLBORN, LONDON, W.C.

For Trade Terms send Card.

GIMINGHAM'S SPRENGEL AIR-PUMP,

with Multiple Fall Tubes and every recent improvement, including McLeod's Low Tension Gauge, Barometer Gauge, Radiometer, Terminals for testing non-conductivity of the Vacuum, &c., &c.

L. CASELLA having arranged with Mr. GIMINGHAM for the Sole Manufacture of these Pumps, as well as his Improved Forms of

CROOKES'S RADIANT MATTER TUBES,

Is prepared to supply them either in their simple form, or with any of their accessories.

Mr. GIMINGHAM has kindly engaged to examine each, in order that no Imperfect Instrument or Tubes may be sent away.

Also GIMINGHAM'S COMBINATION BLOWPIPE for Amateur and Professional Glass Work, the most simple and perfect in use.

L. CASELLA, 147, Holborn Bars, London, E.C.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S

PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

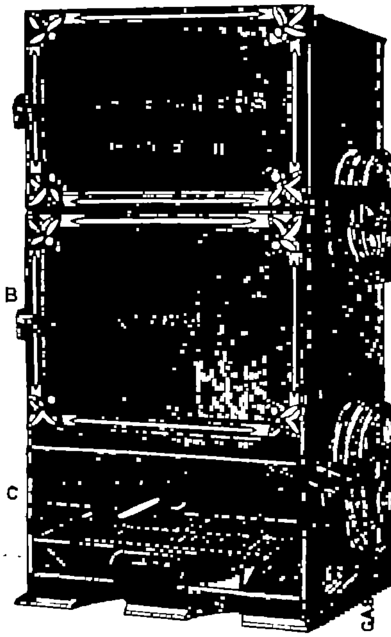
PATERSON'S NEW CATALOGUE OF PHYSICAL APPARATUS.
LANTERN SLIDES for SCIENTIFIC LECTURES Season 1880–1 Post free 6 Stamps.
Complete Sets of Physical Apparatus for Science Primers and all the Physical Text-books in use in Schools and Colleges.
Siemens and Gramme Dynamo Machines and Lamps for hire.
Schools supplied with Apparatus as per Science and Art Departments' Requirements in the Sections of Light, Heat, Sound, and Electricity.
Electric Signals for Houses, Hotels, &c., Colliery Signals, Lightning Conductors. The Gower-Bell Loud-speaking Telephone.
EDWARD PATERSON, Electrical Engineer.
SHOW ROOMS AND STEAM WORKS:—76, LITTLE BRITAIN, E.C. (late 3, Bedford Court, W.C.).
MOLISON'S HARMONOGRAPH; executes the Harmonic Curves in the most perfect manner. 15s. and 20s
Illustrated Catalogue of Electrical Apparatus, Part 1, post free, 6 Stamps. Ditto, Electric Signals, Part 2, 6 Stamps.

FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates, and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).



It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d

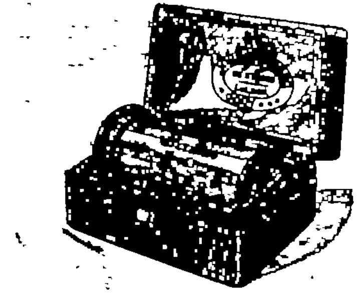
MICROSCOPES,
TRANSIT INSTRUMENTS,
REGULATORS, SPECTROSCOPES,
METEOROLOGICAL AND ELECTRIC APPARATUS,

By ROSS, DALLMEYER, COOKE, SMITH & BECK, BROWNING, DENT, TROUGHTON,
And other Celebrated Makers. All at very Low Prices.

CATALOGUE FREE BY POST.
INSTRUMENTS TAKEN IN EXCHANGE.
ESTABLISHED 1765.

McCLEAN'S STAR SPECTROSCOPE.
(PATENT.)



MR. BROWNING begs to call the attention of scientific gentlemen to McClean's Star Spectroscope, which is by far the most efficient Star Spectroscope yet contrived. It is simply an eyepiece which can be used with any telescope. Being without a slit, there is no difficulty in keeping the spectrum of a star under observation constantly in the field of view, and the spectra are of great brilliancy. Price of the Star Spectroscope in case, £2 10s.

LIST OF PRICES OF SPECTROSCOPES FREE.
Illustrated Catalogue, Sixpence.
JOHN BROWNING, 63, STRAND, LONDON, W.C.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

GEOLOGY AND MINERALOGY.

Special Collections for Teachers and Students, used with success by all Lecturers and Teachers of Geology in Great Britain. Obtained Gold and Bronze Medals at Sydney Exhibition, 1879, also in London, 1862, and Paris, 1867.

			£	s.	d.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish, new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts

JOHN VAN VOORST, 1, Paternoster Row.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by C. G BARRETT, J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., E. SAUNDERS, F.L.S, and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to VI. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month.

THE ART JOURNAL.

NEW SERIES.

With the JANUARY NUMBER a NEW SERIES of the ART JOURNAL was COMMENCED, with several important Alterations and Additions.

THE ART JOURNAL.—ETCHINGS.—An Etching will be included with Every Number of the Journal during the year 1881. The Etching for February is "An Old German Mill," by A. H. Haig.

THE ART JOURNAL.—OLD BATTERSEA BRIDGE, with Facsimiles from Etchings of the Old Bridge and Whistler's House at Chelsea, by Mr S. A. McN. Whistler, appears in the February Number.

THE ART JOURNAL.—INDUSTRIAL ART.—A Series of Illustrated Papers will be continued Monthly on "Our Home Surroundings." The first, on "Chimney-pieces and Over-shelves," is continued in the February Number. The principal Art Furniture Manufacturers have promised their assistance.

THE ART JOURNAL.—Hints to Collectors of ETCHINGS, Water-colour Drawings, Lacquer, Ivories, Marqueterie, China, Turner's Liber Studiorum, &c.—A series of practical Papers on these subjects from the pens of Mr. Seymour Haden, Mr. Roget, Mr. Rawlinson, Mr. Cutler, Mr A. Nesbitt, and others will appear in the course of the year. IVORIES, Part I., by A. Nesbitt, is in the February Number.

THE ART JOURNAL.—ARTISTS will find every information respecting forthcoming Exhibitions and other matters of importance to them. A portion of the Journal will be devoted each month to Queries on Art Matters.

THE ART JOURNAL.—PROOFS of the ETCHINGS.—One Hundred Proofs of each of the Etchings will be printed from the original plates. Price 21s. each, or £10 10s. for the series of 12.

THE ART JOURNAL.—Published Monthly, price 2s. 6d.

London: ART JOURNAL OFFICE, Ivy Lane, Paternoster Row.

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liége, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter.

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription: Twenty-five Shillings, or Twenty-seven Shillings post free.

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London.

In the first two numbers have appeared:—

VAN BENEDEN: On the Embryology of the Mammalia.

VAN BAMBEKE: On the Cleavage of the Egg in Batrachia.

FOETTINGER: On the Termination of Nerves in the Muscles of Insects.

FREDERICQ AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.

MACLEOD: On the Harderian Gland of the Duck, &c., &c.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Français pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d.; six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

CONSCIOUS MATTER:

OR,

THE PHYSICAL and the PSYCHICAL UNIVERSALLY IN CAUSAL CONNECTION.

By W. STEWART DUNCAN.

London: DAVID BOGUE, 3, St. Martin's Place, Trafalgar Square, W.C.

With Illustrations and Maps, medium 8vo, 18s.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific problems of our time."—*Times.*

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

SCIENTIFIC WORKS

PUBLISHED BY

Messrs. LONGMANS & CO.

DICTIONARIES AND ENCYCLOPÆDIAS.

DICTIONARY OF CHEMISTRY AND THE ALLIED BRANCHES OF OTHER SCIENCES. By HENRY WATTS, F.R.S., Editor of the Journal of the Chemical Society, assisted by eminent Scientific and Practical Chemists. 7 vols. 8vo. £10 16s. 6d.

THIRD SUPPLEMENTARY VOLUME, completing the Record of Chemical Discovery to the year 1877. In Two Parts. PART I. 8vo. Price 36s. PART II. Completion in the Press.

GWILT'S ENCYCLOPÆDIA OF ARCHITECTURE, Latest Edition, with Alterations and considerable Additions. By WYATT PAPWORTH. Additionally illustrated with nearly 400 Wood Engravings by O. JEWITT, and upwards of 100 other New Woodcuts. 8vo. 52s. 6d.

URE'S DICTIONARY OF ARTS, MANUFACTURES, AND MINES; Containing a clear Exposition of their Principles and Practice. The Seventh Edition, completely revised and greatly enlarged by ROBERT HUNT, F.R.S., Keeper of Mining Records, assisted by F. W. RUDLER, F.G.S., and by numerous Contributors. With above 2604 Woodcuts. Four vols. Medium 8vo. Price £7 7s.

TEXT-BOOKS OF SCIENCE, MECHANICAL AND PHYSICAL,

FOR THE USE OF ARTISANS AND OF STUDENTS IN PUBLIC AND SCIENCE SCHOOLS.

Edited by C. W. MERRIFIELD, F.R.S.

ABNEY'S PHOTOGRAPHY. 3s. 6d.

ANDERSON'S (Sir J.) STRENGTH of MATERIALS. 3s. 6d.

ARMSTRONG'S ORGANIC CHEMISTRY. 3s. 6d.

BALL'S ASTRONOMY. 6s.

BARRY'S RAILWAY APPLIANCES. 3s. 6d.

BLOXAM'S METALS. 3s. 6d.

GOODEVE'S MECHANICS. 3s. 6d.

GORE'S ELECTRO-METALLURGY. 6s.

GRIFFIN'S ALGEBRA and TRIGONOMETRY. 3s. 6d. NOTES. 3s. 6d.

JENKIN'S ELECTRICITY and MAGNETISM. 3s. 6d.

MAXWELL'S THEORY of HEAT. 3s. 6d.

MERRIFIELD'S TECHNICAL ARITHMETIC. 3s. 6d. KEY. 3s. 6d.

MILLER'S INORGANIC CHEMISTRY. 3s. 6d.

PREECE and SIVEWRIGHT'S TELEGRAPHY. 3s. 6d.

RUTLEY'S STUDY of ROCKS, or TEXT-BOOK OF PETROLOGY. 4s. 6d.

SHELLEY'S WORKSHOP APPLIANCES. 3s. 6d.

THOMÉ'S STRUCTURAL and PHYSIOLOGICAL BOTANY Price 6s.

THORPE'S QUANTITATIVE ANALYSIS. 4s. 6d.

THORPE and MUIR'S QUALITATIVE ANALYSIS. 3s. 6d.

TILDEN'S CHEMICAL PHILOSOPHY. 3s. 6d.

UNWIN'S MACHINE DESIGN. 3s. 6d.

WATSON'S PLANE and SOLID GEOMETRY. 3s. 6d.

MILLER'S ELEMENTS of CHEMISTRY, Theoretical and Practical. PART I. *Chemical Physics.* Sixth Edition, revised, with Additions, by H. MACLEOD, F.C.S. With 274 Woodcuts. 8vo. 16s.

MILLER'S ELEMENTS of CHEMISTRY. PART II. *Inorganic Chemistry.* Sixth Edition, revised throughout with Additions by C. E. GROVES. With 376 Woodcuts. 8vo. 24s.

MILLER'S ELEMENTS of CHEMISTRY. PART III. Fifth Edition, revised, and for the most part rewritten, by H. E. ARMSTRONG, F.R.S., and C. E. GROVES, F.C.S. The Chemistry of Carbon Compounds, or Organic Chemistry, in Two Sections. SECTION I. *Hydrocarbons, Alcohols, Ethers, Aldehides,* and *Paraffinoid Acids;* with 20 Woodcuts. 8vo. 31s. 6d. SECTION II. completion, is in the press.

The ELEMENTS of MECHANISM. By T. M. GOODEVE, M.A., Barrister-at-Law, Lecturer on Applied Mechanics at the Royal School of Mines. New Edition, rewritten and enlarged. With 342 Woodcuts. Crown 8vo. 6s.

EXPERIMENTAL CHEMISTRY for Junior Students. By J. EMERSON REYNOLDS, M.D., F.R.S., Professor of Chemistry, University of Dublin. PART I. *Introductory.* Fcap. 8vo. 1s. 6d.

DESCRIPTIVE and ANALYTICAL BOTANY. Translated from the French Work of DE CAISNE and LE MAOUT by Mrs. HOOKER; edited and arranged by J. D. HOOKER, M.D. With 5500 Woodcuts. Imperial 8vo. Price 31s. 6d.

GANOT'S NATURAL PHILOSOPHY, for GENERAL READERS and YOUNG PERSONS: a Course of Physics divested of Mathematical Formulæ and expressed in the language of daily life. Translated by E. ATKINSON, F.C.S. Fourth Edition. Plates and Woodcuts. Crown 8vo, 7s. 6d.

GANOT'S ELEMENTARY TREATISE on PHYSICS, Experimental and Applied. For the use of Colleges and Schools. Translated by E. ATKINSON, F.C.S. Ninth Edition. Plates and Woodcuts. Large crown, 8vo, 15s.

HEAT a MODE OF MOTION. By JOHN TYNDALL, LL.D., D.C.L., F.R.S. Sixth Edition (Thirteenth Thousand), thoroughly revised and enlarged; with Frontispiece and 123 Woodcuts. Crown 8vo. 12s.

FRAGMENTS of SCIENCE: a Series of detached Essays, Addresses, and Reviews. By JOHN TYNDALL, LL.D., D.C.L., F.R.S. Sixth Edition, revised and augmented. 2 vols., crown 8vo, 16s.

A HANDBOOK of PRACTICAL TELEGRAPHY. By R. S. CULLEY, Member Inst. C.E., Engineer-in-chief of Telegraphs to the Post Office. Seventh Edition, revised and enlarged; with 192 Woodcuts, and 18 Lithographic Plates of Apparatus. 8vo, 16s.

On ARTIFICIAL MANURES, their Chemical Selection and Scientific Applications to Agriculture; a Series of Lectures given at the Experimental Farm, Vincennes. By GEORGES VILLE. Translated and edited by W. CROOKES, F.R.S., V.P.C.S. With 31 Illustrations. 8vo, 21s.

LONDON: LONGMANS, GREEN, & CO.

NEW HIGH-CLASS JOURNAL.

LAND

A Weekly Journal for all interested in LANDED and HOUSE PROPERTY.

WITH "INDEX TO THE ESTATE EXCHANGE REGISTERS."

EVERY SATURDAY, PRICE SIXPENCE.

NUMBER I., READY FEBRUARY 12.

Extract from Prospectus.

The Journal, in short, will do for the Land Market what financial organs do for the Money Market—scanning, discussing, and forecasting every circumstance or contingency likely to affect the great network of interests connected with Real Estate, so that persons of all classes desiring to realise or invest may have full information as to the state of the Market, and timely notice of every circumstance, social, financial, or political, which may influence their decisions.

Owners, Occupiers, Buyers and Sellers of land and houses, Solicitors, Surveyors, Land Agents, and Auctioneers, will each and all find in LAND not only indispensable and accurate records of past, but also suggestive and trustworthy guidance for future transactions.

TERMS OF SUBSCRIPTION: One Year, 26s. (*or by post*, 28s.); Half-Year, 13s. (*or by post*, 14s.); Quarter, 6s. 6d. (*or by post* 7s.).

A TREATISE ON

COMPARATIVE EMBRYOLOGY.

By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. In Two Vols. Illustrated.

"It is scarcely possible to exaggerate the expressions of gratitude which are due from zoologists to Mr. Balfour for the execution of the great task which some three or four years ago he set himself. . . . Zoologists have to be thankful to him for the admirable style in which he has carried out his work."—*Nature.*

Just Published, demy 8vo, cloth, with Chart, price 15s.

ON SOME PROPERTIES OF THE EARTH.

By O REICHENBACH.

London: WERTHEIMER, LEA, & CO., Circus Place, London Wall.

Sale by Auction.

The Natural History, Ethnological, Geological, and other Collections of the late E. W. COOKE, Esq., R A., F.R.S.

MR. J. C. STEVENS has been favoured with Instructions to Sell by Auction, at his Great Rooms, 38, King Street, Covent Garden, on FRIDAY, February 25th, at half-past 12 precisely, by order of the Executor, the Collections of Objects of Natural History, Ethnology, Archæology, Geology, &c.; also Loddige's Botanical Cabinet, a rare and valuable work Also a fine Collection of Casts from Antique Gems and other Curiosities collected by the late E. W. COOKE, Esq., R.A., F.R.S.

On view after 2 o'clock the day prior and morning of Sale, and Catalogues had

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,

With the Assistance of

FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

Just Published, price 2s. 6d.

An ELEMENTARY COURSE of PRACTICAL PHYSICS.

By A M. WORTHINGTON, M.A, F.R.A.S., Assistant Master at Clifton College.

RIVINGTONS, Waterloo Place, Pall Mall. London.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by C. G. BARRETT, J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., E. SAUNDERS, F.L.S, and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to VI. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests, Subscription, 16s. 6d. per annum, post free, dating from any quarter-day. Single Copies 1s. each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

Price 6s., Part II., Vol. XV., January, 1881.

THE JOURNAL OF ANATOMY AND PHYSIOLOGY, NORMAL AND PATHOLOGICAL.

CONDUCTED BY

Profs. HUMPHRY, TURNER, M'KENDRICK, & Dr. CREIGHTON.

Contents.

1. Bones, Articulations, and Muscles of Rudimentary Hind-limb of Greenland Right-Whale. By J. Struthers, M D. (Plates XIV.–XVII.)
2. Infective Form of Tuberculosis in Man identical with Bovine Tuberculosis. By C Creighton, M.D.
3. Medullary Neuroma of Brain By W. Osler, M.D. (Plate XVIII.)
4. Dissection of Genito-Urinary Organs in Case of Fissure of Abdominal Walls. By A. Doran, F.R.C.S. (Plate XIX.)
5. Description of a Polygraph (with Figure). By D. Newman, M.B.
6. Remarks on Mechanism of Secretion of Sweat. By C. Handfield Jones, M.B
7. Anomalous Growth-Bearing Pilose Skin in Pharynx of a Young Woman. By P. S. Abraham, M A. (With Figure)
8. Histology of Granular Kidney (with Figure) By R. Saundby, M.D.
9. Two Cases of Cerebellar Disease. By T. Oliver, M.D.
10. Colouring Matter of Jelly Fishes By Prof M'Kendrick.
11. Nerves of the Hind-Limb of the Thylacine and Cuscus. By D. J. Cunningham, M D.
12. Pulse Dicrotism By Wm. Jas. Fleming, M.D.
13. Anatomical Notices.

MACMILLAN & CO, London and Cambridge.

MACMILLAN & CO. LONDON.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S

PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm

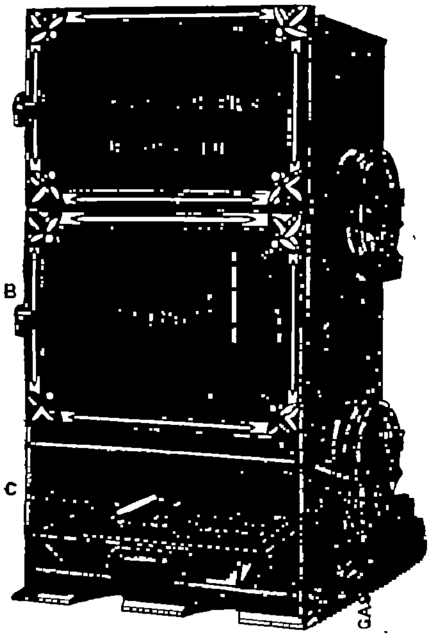
FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).



It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike.

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2*d.*

WORKS ON SCIENCE AND THE USEFUL ARTS

PUBLISHED BY MESSRS. LONGMANS & CO.

GANOT'S ELEMENTARY TREATISE ON PHYSICS, Experimental and Applied, for the use of Colleges and Schools. Translated and Edited, with the Author's sanction, by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College. The Ninth Edition; with 4 Coloured Plates and 844 Woodcuts. Large crown 8vo. Price 15*s.*

"This well-known work has been before the public for sixteen years, and has now reached a ninth edition. Each new edition has contained both additions and revisions in accordance with the progress of science. The present edition differs from the last by an increase of subject-matter of twenty-five pages, while twenty-four new illustrations have been added. The illustrations are extremely good, and the various subjects are discussed with a sufficient infusion of mathematics to make the book serviceable for the use of the highest forms in schools, and for scholarships and other examinations."—*Academy.*

GANOT'S NATURAL PHILOSOPHY, FOR GENERAL READERS AND YOUNG PERSONS: a Course of Physics divested of Mathematical Formulæ and expressed in the language of daily life. Translated and Edited, with the Author's sanction, by E. ATKINSON, F.C.S. The Fourth Edition, completely revised; with 25 pages of New Matter, 2 Coloured Plates, and 471 Woodcuts, of which 16 are New in this Edition. Crown 8vo. Price 7*s.* 6*d.*

"We are glad to notice this volume, which will prove useful to a wide circle of readers and teachers, since it represents the amount of knowledge required for the matriculation examination of the London University. It is divided into eight books, treating respectively of the General Properties of Matter, Hydrostatics, Gases, Acoustics, Heat, Light, Magnetism, and Electricity. It is admirably illustrated, and throughout most clearly written. It ought to be in the hands of the higher classes of all our public schools; and if the principal facts it contains were early demonstrated by experiment to those about to become members of the profession, we should have a far larger number of accurate observers, and much fewer loose theories than at present."—*Lancet.*

POPULAR LECTURES ON SCIENTIFIC SUBJECTS, Second Series, comprising the Origin and Signification of Geometrical Axioms, the relation of Form, Shade, Colour and Harmony of Colour to Painting, the Origin of the Planetary System, &c. By H. HELMHOLTZ, Professor of Physics in the University of Berlin. Translated by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College. With 17 Woodcuts. Crown 8vo. Price 7*s.* 6*d.*

PROF. HELMHOLTZ' FIRST SERIES OF LECTURES ON SCIENTIFIC SUBJECTS. Translated by Prof. ATKINSON, with Introduction by Prof. TYNDALL, F.R.S. Second Edition, revised; with 51 Woodcuts, uniform with the Second Series. Crown 8vo. Price 7*s.* 6*d.*

FRAGMENTS OF SCIENCE: a Series of detached Essays, Addresses, and Reviews. By JOHN TYNDALL, LL.D., D.C.L., F.R.S. Sixth Edition, revised and augmented. 2 vols. Crown 8vo. 16*s.*

HEAT A MODE OF MOTION. By JOHN TYNDALL, LL.D, D.C.L., F.R.S. Sixth Edition (Thirteenth Thousand), thoroughly revised and enlarged; with Frontispiece and 123 Woodcuts. Crown 8vo. 12*s.*

THE ELEMENTS OF MECHANISM. By T. M. GOODEVE, M.A., Barrister-at-Law, Lecturer on Applied Mechanics at the Royal School of Mines. New Edition, rewritten and enlarged; with 342 Woodcuts. Crown 8vo. 6*s.*

MILLER'S ELEMENTS OF CHEMISTRY, Theoretical and Practical. Part I. *Chemical Physics.* Sixth Edition, revised, with Additions, by H. MACLEOD, F.C.S. With 274 Woodcuts. 8vo. 16*s.*

MILLER'S ELEMENTS OF CHEMISTRY. Part II. *Inorganic Chemistry.* Sixth Edition, revised throughout, with Additions by C. E. GROVES. With 376 Woodcuts. 8vo. 24*s.*

MILLER'S ELEMENTS OF CHEMISTRY. Part III. Fifth Edition, revised, and for the most part rewritten, by H. E. ARMSTRONG, F.R.S. and C. E. GROVES, F.C.S. The Chemistry of Carbon Compounds, or Organic Chemistry, in Two Sections. SECTION I. *Hydrocarbons, Alcohols, Ethers, Aldehydes,* and *Paraffinoid Acids;* with 20 Woodcuts. 8vo. 31*s.* 6*d.* SECTION II., completion, is in the press.

DICTIONARY OF CHEMISTRY AND THE ALLIED BRANCHES OF OTHER SCIENCES. By HENRY WATTS, F.R.S., Editor of the *Journal* of the Chemical Society, assisted by eminent Scientific and Practical Chemists. 7 vols. 8vo. £10 16*s.* 6*d.*

THIRD SUPPLEMENTARY VOLUME, completing the Record of Chemical Discovery to the Year 1877. In Two Parts. PART I. 8vo. price 36*s.* PART II., completion, in the Press.

URE'S DICTIONARY OF ARTS, MANUFACTURES, AND MINES; Containing a clear Exposition of their Principles and Practice. The Seventh Edition, completely revised and greatly enlarged by ROBERT HUNT, F.R.S., Keeper of Mining Records, assisted by F. W. RUDLER, F.G.S., and by numerous Contributors. With above 2604 Woodcuts. 4 vols. medium 8vo. Price £7 7*s.*

ON ARTIFICIAL MANURES, their Chemical Selection and Scientific Applications to Agriculture; a Series of Lectures given at the Experimental Farm, Vincennes. By GEORGES VILLE. Translated and Edited by W. CROOKES, F.R.S., V.P.C.S. With 31 Illustrations, 8vo. 21*s.*

A TREATISE ON MILLS AND MILL-WORK. By the late Sir W. FAIRBAIRN, Bart., C.E. Fourth Edition, with 18 Plates and 333 Woodcuts. 1 vol, 8vo. 25*s.*

A HANDBOOK OF PRACTICAL TELEGRAPHY. By R. S. CULLEY, Member Inst. C.E., Engineer-in-Chief of Telegraphs to the Post Office. Seventh Edition, revised and enlarged; with 132 Woodcuts, and 18 Lithographic Plates of Apparatus. 8vo. 16*s.*

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture. By Prof. STOKES, Sec.R.S. 6th April, 1881.

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena By Lieut.-General STRACHEY, R.E., C.S.I., F.R.S. 8th April.

Two Lectures on the Connection between Solar and Terrestrial Phenomena By Prof. BALFOUR STEWART, F.R.S. 27th and 29th April

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. NORMAN LOCKYER, F.R.S 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics By Capt. ABNEY, R.E., F.R.S 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m, on the days stated above.

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the SECRETARY, Science and Art Department, South Kensington, S.W

ASSOCIATION for the IMPROVEMENT OF GEOMETRICAL TEACHING.

SEVENTH GENERAL REPORT, containing the Address of the President, H. B. HAYWARD, Esq., F.R.S., on "The Future of the Association." Price Sixpence. Complete Sets of the Reports of the Association, &c. 3s 6d

Apply by letter, inclosing Stamps or P.O.O., to Mr. JOSIAH ALLEN, Printer, 74, Suffolk Street, Birmingham.

MICROSCOPES.

C. BAKER, of 244, High Holborn, begs to call the attention of the Scientific to his large stock of ACHROMATIC MICROSCOPES, BINOCULAR AND MONOCULAR, at extremely low prices, commencing from £3 10s. OBJECT-GLASSES, APPARATUS, OBJECTS, and MATERIALS of all kinds kept in stock. Catalogues free by post.

C. BAKER being the appointed Agent for ZEISS, SEIBERT, and other first-class GERMAN MAKERS, is now supplying their beautiful productions at very Low Prices. ZEISS's new HOMOGENEOUS and other IMMERSION OBJECTIVES now in stock. Catalogue free by post.

A Large Assortment of SECOND-HAND MICROSCOPES, and other Scientific Instruments in stock at the Lowest Prices. Lists of same forwarded on application.

Instruments taken in Exchange.

ESTABLISHED 1765.

BROWNING'S MICROSCOPES.

The "COMPLETE" MICROSCOPE, with rack and fine adjustment to body, mechanical motions to stage, removable fittings for apparatus, revolving diaphragm with 3 apertures, A or B eyepiece, 1-in. 16° and ¼-in. 75° objectives, of which the performance will be guaranteed.

PRICE £7 10s. 0d.

Price List of Microscopes Free.

A New Edition of the Illustrated Catalogue of Microscopes, with 41 Illustrations, 19 whole-page engravings, post free, 7 stamps.

BROWNING'S new Cheap Series of high-power Objectives, ¼-in. 80°, £1 7s. 6d., ⅙-in. 90°, £2 12s 6d; ⅛-in. 95°, £3 5s. 0d.

JOHN BROWNING,

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price 7s. 6d.

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful Lens, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust —THOMAS J. DOWNING, GEOLOGIST, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As

it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

Now publishing, in Crown 8vo. Price 2*s.* 6*d.* each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold

WORDSWORTH. By F. W. H. MYERS.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof. NICHOL.

"Decidedly one of the most careful and valuable of the whole series."—*Athenæum.*

POPE. By LESLIE STEPHEN.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

CHAUCER. By Prof. A. W. WARD.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings."—*Athenæum.*

DEFOE. By W. MINTO.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.

". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

*** *Others in Preparation.*

MACMILLAN AND CO., LONDON.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

MANUALS OF ELEMENTARY SCIENCE.

Fcap. 8vo, limp cloth, 1*s.*

Just published

ELECTRICITY. By Professor Fleeming Jenkin, F.R.S. With numerous Illustrations.

NATURAL HISTORY OF BRITISH FISHES: Their Structure, Economic Uses, and Capture by Net and Rod. Cultivation of Fish-Ponds, Fish suited for Acclimatisation, Artificial Breeding of Salmon. By the late FRANK BUCKLAND, H.M. Inspector of Fisheries. With numerous Woodcuts. Crown 8vo, cloth boards, 5*s.*

"The Christian Knowledge Society has done well in republishing such a delightful, and at the same time valuable book."—*Graphic.*

CHIEF ANCIENT PHILOSOPHIES.

[This Series of Books will deal with the Chief Systems of Ancient Thought, not merely as dry matters of History, but as having a bearing on Modern Speculation.]

EPICUREANISM. By William Wallace, M.A., Fellow and Tutor of Merton College, Oxford. Fcap. 8vo, satteen cloth boards, 2*s.* 6*d.*

"This little volume appears to us an almost model handbook."—*Pall Mall Gazette.*

STOICISM. By the Rev. W. W. Capes, M.A., Fellow of Hertford College. Fcap. 8vo, satteen cloth boards, 2*s.* 6*d.*

"To sum up, we think the style and tone of the book worthy of high praise; its moral and philosophic criticism singularly just and searching."—*Pall Mall Gazette.*

"We may permit ourselves to point to the clearness and style of arrangement which distinguish both these little treatises."—*Times.*

MANUALS OF HEALTH.

Fcap 8vo, 128 pages, limp cloth, 1*s.* each.

The Habitation in Relation to HEALTH. By F. S. B. FRANÇOIS CHAUMONT, M.D., F.R.S., Professor of Military Hygiene in the Army Medical School, Netley.

"The book, small as it is, should be in every house."—*Land and Water.*

On Health and Occupation. By BENJAMIN WARD RICHARDSON, Esq., F.R.S., M.D., M.A.

"The Manuals of Health, published by the Society for Promoting Christian Knowledge, should be in the possession of every family that is not utterly careless of its own safety and welfare."—*Illustrated London News.*

On Personal Care of Health. By the late E. A. PARKES, M.D., F.R.S.

"The Society for Promoting Christian Knowledge has conferred a very great benefit, principally on the poor and on those who have much intercourse with the poor, but incidentally on persons in all ranks, by the publication of this little manual on personal care of health."—*Pall Mall Gazette.*

Food. By Albert J. Bernays, Professor of Chemistry at St. Thomas's Hospital.

"Nothing could be better than Dr. Bernays' little work, and we cordially recommend it to every one that finds it necessary to consider either his stomach or his purse."—*Church Times*

Water, Air, and Disinfectants. By W. NOEL HARTLEY, Esq., King's College.

"The present volume, from the pen of Mr. Hartley, is well fitted to become a recognised authority, friend, and companion in every home in England"—*Echo*

THE ZOOLOGIST:
A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish, new or rare marine fish; local aquaria, British reptiles; British land and fresh-water mollusca, with remarks on the habitats and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Français pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d., six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21s.

Just ready. 44 pages 8vo. 1s.

CORRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy.*

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum.*

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic.*

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory.*

MACMILLAN AND CO., LONDON.

New Lists of Collections, Apparatus, &c., now ready, and free on application to

JAMES R. GREGORY'S
Geological Museum and Repository,
88, CHARLOTTE STREET, FITZROY SQUARE.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

100 Specimens, in Cabinet, with 3 Trays	... ...	£2 2 0
200 Specimens, in Cabinet, with 5 Trays	... ...	5 5 0
300 Specimens, in Cabinet, with 9 Drawers	... ...	10 10 0
400 Specimens, in Cabinet, with 13 Drawers	... ...	21 0 0

More extensive Collections at 50 to 5,000 Guineas each.

MUSEUMS AND COLLECTORS.

MR. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by John T. Carrington,
With the Assistance of
Frederick Bond, F.Z.S. | John A. Power, M.D.
Edward A. Fitch, F.L.S. | J. Jenner Weir, F.L.S.
F. Buchanan White, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous Woodcut Illustrations, to the printing of which especial attention is given, and occasional Lithographed and Chromo-Lithographed Plates.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

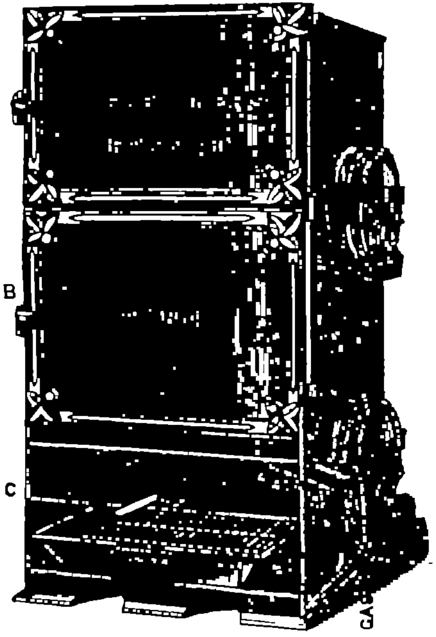
FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).



It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d

Registered as a Newspaper at the General Post Office.]

[All Rights are Reserved.

THE MASON SCIENCE COLLEGE, BIRMINGHAM.

APPOINTMENT OF ADDITIONAL PROFESSORS.

The Trustees intend from the commencement of the Second Session of the College, on the 1st of October next, to enlarge the Course of Instruction.

The present Chairs are Mathematics (Prof M J M. HILL, M.A. Cantab), Chemistry (Prof W. A. TILDEN, D Sc Lond., F R.S.), Physics (Prof J. H. POYNTING, M A Cantab , B.Sc. Lond.), and Biology (Prof T. W. BRIDGE, M.A Cantab., F L S.). In the ensuing Season Prof. Tilden will add Metallurgy to his Course.

The Trustees invite applications (to be sent to "Mr. G. H. Morley, Secretary, The Mason Science College, Birmingham," on or before the 30th of April next) for the following additional Professorships and Lectureships, viz :—

1.—A Professor of Physiology, with special reference to the Laws of Health.
2.—A Professor of Geology and Mineralogy.
3.—A Professor of Civil and Mechanical Engineering
4.—A Professor of Latin and Greek.
5.—A Professor of English Language and Literature
6.—A Lecturer on the French Language
7.—A Lecturer on the German Language.

Particulars of the Salaries and Conditions will be sent by the Secretary on application.

By a resolution of the Trustees, Candidates are especially requested to abstain from canvassing.

JOSIAH MASON, Bailiff.
J. GIBBS BLAKE, M D., Chairman of Trustees.
G J JOHNSON, Hon. Sec

Edmund Street, Birmingham, February 23rd, 1881.

MICROSCOPES.

C. BAKER, of 244, High Holborn, begs to call the attention of the Scientific to his large stock of ACHROMATIC MICROSCOPES, BINOCULAR AND MONOCULAR, at extremely low prices, commencing from £3 10*s*. OBJECT-GLASSES, APPARATUS, OBJECTS, and MATERIALS of all kinds kept in stock. Catalogues free by post.

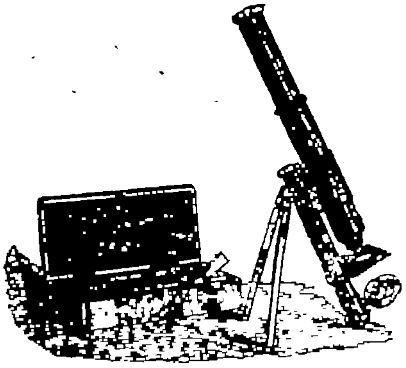
C. BAKER being the appointed Agent for ZEISS, SEIBERT, and other first-class GERMAN MAKERS, is now supplying their beautiful productions at very Low Prices. ZEISS's new HOMOGENEOUS and other IMMERSION OBJECTIVES now in stock. Catalogue free by post.

A Large Assortment of first-class *Second-hand Microscopes* by *Ross*, *Powell*, and *Beck*; also other Scientific Instruments in stock, by the most esteemed makers, at the Lowest Prices. Lists of same forwarded on application.

Instruments taken in Exchange.

ESTABLISHED 1765.

BROWNING'S POCKET MICROSCOPE.



The New Pocket or Field Microscope, on Firm Folding Brass Tripod Stand, with fine Adjustment, 1-inch Objective, Large Field Eye-piece, Hand-pliers, &c ; height when set up, 10 inches; dimensions, packed in Morocco Case, 5¼ inches long. Price £1 11*s*. 6*d*

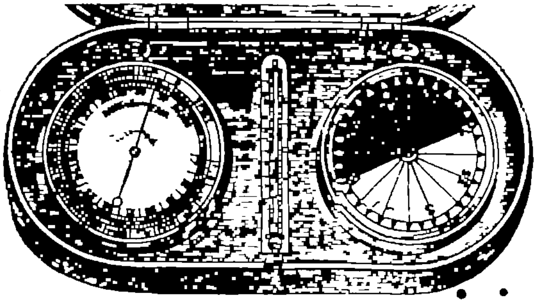
Or with 1-inch and 2-inch Objectives, Stage, Forceps, Stage Plate, and Dipping Tube, £2 2*s*.

List of Microscopes sent free.

Illustrated Catalogue of Microscopes, with 41 Illustrations, 10 whole page Illustrations, sent for Six Stamps

JOHN BROWNING,
Optical and Physical Instrument Maker to Her Majesty's Government, the Royal Society, the Royal Observatories of Greenwich, Edinburgh, &c., &c.,
63, STRAND, LONDON, W.C.

TRAVELLERS'. SCIENTIFIC REQUISITES.



ANEROID BAROMETER with ALTITUDE SCALE, THERMOMETER and COMPASS in Flat Pocket Case, various Forms,
£7 7s. and £8 8s.

Price Lists of Instruments free by post.

NEGRETTI & ZAMBRA,
Opticians and Scientific Instrument Makers
To HER MAJESTY THE QUEEN,
HOLBORN VIADUCT,

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture. By Prof. STOKES, Sec.R.S. 6th April, 1881.

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena. By Lieut.-General STRACHEY, R.E., C.S.I., F.R.S. 8th April.

Two Lectures on the Connection between Solar and Terrestrial Phenomena. By Prof. BALFOUR STEWART, F.R.S. 27th and 29th April.

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. NORMAN LOCKYER, F.R.S. 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics. By Capt. ABNEY, R.E., F.R.S. 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m. on the days stated above.

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the SECRETARY, Science and Art Department, South Kensington, S.W.

MATRICULATION of the UNIVERSITY OF LONDON.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.

A CLASS in all the Subjects of this Examination will begin on MONDAY, March 7, and continue till the Examination in July. The Class is not confined to Students of the Hospital.

For particulars apply to the WARDEN of the College, St. Bartholomew's Hospital, London, E.C.

A Handbook is forwarded on application.

LONDON UNIVERSITY, ARMY, CIVIL SERVICE.

Dr. R. H. JUDE, D.Sc. (Lond.), M.A. (Cantab.), High Wrangler, First Class Natural Science Tripos, late Scholar of Christ's and sometime Demonstrator of Chemistry at Caius College, Cambridge, with qualified Assistants, prepares Gentlemen in all the subjects for the above Exams.

Natural Science treated both experimentally and theoretically.

Highest Testimonials and References to present and former Pupils. A few Pupils taught by Correspondence. Special Classes now forming for Matriculation, B.A., B.Sc., and Prel. Sci.

119, Cambridge Gardens, Notting Hill, W.

CONCHOLOGY.

The Survivor of Rigacci Brothers, Rome, wishes to DISPOSE of their well-known CONCHOLOGICAL COLLECTION, which contains more than 10,000 Species of Recent Shells, and a great number of Fossil Shells from the Paris Basin, Belgium, Vienna, England, Russia, Tuscany, Sicily, and other countries, besides a peculiarly valuable Collection from Monte Mario near Rome, together with the Library relating to the subject. Signor Rigacci therefore begs to inform the Directors of Public Museums and Naturalists that he is prepared to treat for the Sale of the above-mentioned Collection and Library, and to supply a printed Catalogue.—Address VINCENZO RIGACCI, No. 5, Piazza Campo Marzio, Rome.

FOR SALE, at Half Original Cost, RUHMKORFF COIL,

by Owen, City Road, producing 3-inch Sparks, £6. Rotating Spark Magnet in Vacuum-jar, Gealer Fountain and Uranium Cap, 30-inch Uranium Vacuum-tube mounted on Stand. Three large Vacuum-tubes, Phosphorus, Hydrogen, and Quinine. Also an Analytical Balance by Oerthng, nearly new. No. 3 in Glass Case; 12-inch Beam; cost £8 8s.; will be sold for £6.—A. DECK, 9, King's Parade, Cambridge.

PREHISTORIC AND ANTIQUARIAN

COLLECTION for Sale; containing many interesting and choice Specimens from all parts of the World, formed with much trouble and at considerable expense. Apply for Particulars by Post to R. P. GREG, Esq., F.G.S., &c., Coles, Buntingford, Herts.

ROYAL POLYTECHNIC.—CLASSES for

the Preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers *Batrachospermum moniliforme*, with Drawing and Description. He has also sent out Young American Trout and Salmon; also Ova of Great Lake Trout and Salmon. Also Lophopus, Marine Polyzoa, Hydrozoa, and Crustacea, Argulus, Volvox, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

NORTH BRITISH AGRICULTURIST

Is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

"The leading Farmers' paper."—Clare Sewell Read, Esq., M.P.

London: LONGMANS & CO.

LATEST EDITION OF GANOT'S PHYSICS.

In large crown 8vo, illustrated by 4 Coloured Plates and 844 Woodcuts, price 15s., cloth.

ELEMENTARY TREATISE on PHYSICS,

Experimental and Applied, for the use of Colleges and Schools. Translated and Edited, with the Author's sanction, from GANOT'S "Éléments de Physique" by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College, Sandhurst. Ninth Edition, Revised and Enlarged.

"This well-known work has been before the public for sixteen years, and has now reached a ninth edition. Each new edition has contained both additions and revisions in accordance with the progress of science. The present edition differs from the last by an increase of subject-matter of twenty-five pages, while twenty-four new illustrations have been added. The illustrations are extremely good, and the various subjects are discussed with a sufficient infusion of mathematics to make the book serviceable for the use of the highest forms in schools and for scholarship and other examinations."—*Academy.*

By the same Translator, in crown 8vo, price 7s. 6d.

GANOT'S NATURAL PHILOSOPHY for GENERAL READERS and YOUNG PERSONS.

"A better book than this, on organic chemistry, has never been written in any language."—*Pharmaceutical Journal.*

"Must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., London.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by C. G. BARRETT, J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., E. SAUNDERS, F.L.S, and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to VI. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

GEOLOGY AND MINERALOGY.

IN the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE-WRIGHT, MINERALOGIST, 90, Great Russell Street, W.C.

50 Specimens in Cabinet	£1 0 0
100 " "	2 0 0
200 " "	5 0 0

&c., &c.

More extensive Collections from 50 to 2000 Guineas.

DIARY OF SOCIETIES.

London

THURSDAY, March 10.

Royal Society, at 4.30.—On the Conversion of Radiant Energy into Sonorous Vibrations: W. H. Preece.—On the Limit of the Liquid State: J. B. Hannay.—On the Diastase of Kōji: Prof. R. W. Atkinson.

Society of Telegraph Engineers, at 8.—Earth-Currents—Electric Tides. Mr. A. J. S. Adams's Reply to Observations on his Paper.—On the Application of Dynamo-Electric Machines to Railway Rolling Stock: Lieut. P. Cardew.—On the Interference with the Processes of Manufacture of Wool and Hair, arising from the Development of Electricity during Spinning; with a Description of Apparatus applied to obviate it: Edward B. Bright.

Mathematical Society, at 8.—An Application of Elliptic Function to the Nodal Cubic: R. A. Roberts.—On the Flexure and Equilibrium of a Skew Surface: Prof. Cayley, F.R.S.—A Note on Prof. C. S. Peirce's Probability Notation of 1867: H. McColl.

London Institution, at 7.—Prospects of Architecture in Modern Civilisation: William Morris.

Royal Institution, at 3.—Cuneiform Characters: Rev. W. Houghton.

FRIDAY, March 11.

Royal College of Surgeons, at 4.—The Cetacea: Prof. Flower.

Quekett Microscopical Club, at 8.

Royal Institution, at 9.—Language and Literature of the Scottish Highlands: Prof. J. S. Blackie.

SATURDAY, March 12.

Physical Society, at 3.—On the Absorption Spectra of Organic Bodies: Col. Festing and Capt. Abney.

Royal Institution, at 3.—Ancient Egypt: R. S. Poole.

SUNDAY, March 13.

Sunday Lecture Society, at 4.—The Liver: Mrs. Fenwick Miller.

MONDAY, March 14.

Royal College of Surgeons, at 4.—The Cetacea: Prof. Flower.

Royal Geographical Society, at 8.30.

Society of Arts, at 8.—Electric Lighting: Prof. W. G. Adams.

London Institution, at 5.—Gold and Silver Mines of the World: G. Phillips Bevan.

Aristotelian Society, at 7.30.—Kant: S. Oliver.

TUESDAY, March 15.

Zoological Society, at 8.30.—On Additions to the Society's Collection during the Month of February, 1881: The Secretary.—Observations on the Characters of the Echinoidea. Part IV. The *Echinometridae*; their Affinities and Systematic Position: Prof. F. Jeffrey Bell, F.Z.S.—Contributions to the Anatomy of Passerine Birds. Part IV. On some Points in the Anatomy of the Genus *Conopophaga* and its Systematic Position: W. A. Forbes.

Royal Institution, at 3.—The Blood: Prof. Schäfer.

Society of Arts, at 8.—Diamond Fields of South Africa: R. W. Murray.

West London Scientific Association, at 8.—Movements of Plants: Rev. G. Henslow.

Statistical Society, at 7.45.—The Progress of the English Stations in the Hill Regions of India: Hyde Clarke.

London Institution, at 8.—Sanitary Assurance: Prof. de Chaumont, F.R.S.

WEDNESDAY, March 16.

Royal College of Surgeons, at 4.—The Cetacea: Prof. Flower.

Society of Arts, at 8.—The Compound Air-Engine: Col. F. Beaumont.

Meteorological Society, at 7.—Exhibition of Instruments.

THURSDAY, March 17.

Royal Society, at 4.30.

Linnean Society, at 8.—On the Indian Species of *Primula*: Dr. George Watt.—Mollusca of *Challenger*. Part 9: Rev. R. Boog Watson.—Note on *Hibiscus palustris*, Linn., and certain Allied Species: B. Daydon Jackson.

Chemical Society, at 8.—On the Volumes of Mixed Liquids: F. D. Brown.—On Boron Hydride: F. Jones.—On the Action of Aldehydes on Phenanthraquinone in presence of Ammonia: F. R. Japp and Edgar Wilcock.—On the Action of Benzoic Acid on Naphthaquinone: F. R. Japp and H. J. N. Miller.—On the Alleged Formation of Nitrous Acid during the Evaporation of Water: R. Warington.—On the Absorption of Solar Rays by Atmospheric Ozone and on the Blue Tint of the Atmosphere: Prof. Hartley.—Note on the Sweet Principle of Smilax Glycyphylla: C. R. A. Wright and E. H. Rennie.

Royal Institution, at 3.—Ornament: H. H. Statham.

London Institution, at 7.—Combination of Voices with Instruments: Dr. W. H. Stone.

Numismatic Society, at 7.

FRIDAY, March 18.

Royal College of Surgeons, at 4.—The Cetacea: Prof. Flower.

Royal Institution, at 9.—Musical Pitch: Dr. W. H. Stone.

SATURDAY, March 19.

Royal Institution, at 3.—American Humorists: Rev. H. R. Haweis.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

MANUAL OF ANCIENT GEOGRAPHY. From the German of Dr. H. KIEPERT. Crown 8vo. 5*s.*

DR. FRANCIS SIBSON'S COLLECTED WORKS. Edited by W. M. ORD, M.D. With Illustrations. Four Vols. 8vo. [*Next week.*

THROUGH THE RANKS TO A COMMISSION. Crown 8vo. 6*s.*

This volume records the experiences of an aspirant to a military career, who, being too old to obtain a commission by the ordinary road of Examination, made up his mind to win it by working his way up through the ranks. He succeeded in the unprecedentedly short period of fifteen months. No one has hitherto had such an opportunity of describing the daily life of our soldiers from the inside. As it bears no author's name, the Publishers feel bound to state that they have seen documents and letters from well-known persons which leave no doubt in their minds as to the authenticity of the narrative.

"MACMILLAN'S BIOGRAPHICAL SERIES." NEW VOLUME.

CATHERINE AND CRAUFURD TAIT, WIFE AND SON OF ARCHIBALD CAMPBELL, ARCHBISHOP OF CANTERBURY: a Memoir. Edited, at the request of the Archbishop, by the Rev. W. BENHAM, B.D., Vicar of Marden, and one of the Six Preachers of Canterbury Cathedral. With Two Portraits engraved by JEENS. New and Cheaper Edition. Crown 8vo. 6*s.*

THE MAKERS OF FLORENCE: Dante, Giotto, Savonarola, and their City. By Mrs. OLIPHANT. With Illustrations from Drawings by Prof. DELAMOTTE, and a Steel Portrait of Savonarola, engraved by C. H. JEENS. Third and Cheaper Edition. Crown 8vo. 10*s.* 6*d.*

NEW VOLUME OF MACMILLAN'S POPULAR SIX SHILLING NOVELS.

A BELEAGUERED CITY: being a Narrative of Certain Recent Events in the City of Semur, in the Department of the Haute Bourgogne. A Story of the Seen and Unseen. By Mrs. OLIPHANT.

"The story is a powerful one, and very original to boot."—*Times.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. New Volume. Crown 8vo. 2*s.* 6*d.*

DRYDEN. By GEORGE SAINTSBURY.

NEW NOVEL BY HENRY JAMES, Jun.

WASHINGTON SQUARE: THE PENSION BEAUREPAS: A BUNDLE OF LETTERS. 2 vols. Crown 8vo. 21*s.*

"Indeed a critic can only wonder why Mr. James has avoided till to-day a topic so rich . . . and what more could the heart of a writer desire than to have a new world at his feet waiting only to be written about, and an audience waiting only to read? . . . Of the short stories . . . space only permits it to be said that they contain three delightful new types of Americans."—*Pall Mall Gazette.*

NEW NOVEL, A STORY OF THE GREEK WAR.

LOUKIS LARAS; or, the Reminiscences of a Chiote Merchant during the Greek War of Independence. From the Greek of D. BIKÉLAS. Translated, with Introduction on the Rise and Development of Modern Greek Literature, by J. GENNADIUS, late Chargé-d'Affaires at the Greek Legation in London. Crown 8vo. 7*s.* 6*d.*

"Mr. Bikélas is a kind of Greek Erckmann-Chatrian, he paints the manners of country people. . . . The description of the life in Chios, of the approach of the Turkish Fleet, of the flight to the old defenceless tower, are most vivid and full of simple force."—*Pall Mall Gazette.*

"Mr. Gennadius writes good English, and one can be sure that he has faithfully interpreted the original. . . . The tale here presented in an English dress may already be said to have achieved a European reputation."—*St. James's Gazette.*

MACMILLAN AND CO., LONDON, W.C.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, March 10, 1881.

EDITED BY W. CROOKES, F.R.S., &c.

Published every Friday. Price 4d.

No. 1112 (March 18th, 1881) contains:—Solubility of Sulphur Dioxide in Sulphuric Acid, by J. T. Dunn, B.Sc.—Analyses of some Geyser Deposits, by Henry Leffmann, M.D.—Action of Sea-Water upon Cast Iron, by Prof. Liversidge.—The Relations between the Atomic Weights.—The Alkaloid from Pituria, by Prof. Liversidge.—Proceedings of Societies.—Notices of Books.—Correspondence.—Chemical Notices from Foreign Sources.—Notes and Queries, &c., &c.

London: Boy Court, Ludgate Hill, E.C.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY, BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S., British Museum.

CONTENTS.—Original Articles by leading Botanists.—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News.—Proceedings of Societies.

Price 1s. 3d. Subscription for One Year, payable in advance, 12s.

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests.

Subscription, 16s. 6d. per annum, post free, dating from any quarter-day. Single Copies 1s. each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh.

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

The MORPHOLOGY of the SKULL. By

W. K. PARKER, F.R.S., Hunterian Professor, Royal College of Surgeons, and G. T. BETTANY, B.Sc., Lecturer on Botany in Guy's Hospital Medical School. Illustrated. Crown 8vo. 10s. 6d.

MACMILLAN & CO., London.

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects. Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least; frequent supplements and drawings. Subscription at any time; preceding numbers of the year furnished subsequently. Price 12s. for twelve months. Advertisements 4d. a line, widely spread by this paper, considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall, 28. Edited by W. v. FREEDEN, M.R., Hamburg, Alexander Street, 8.

HUXLEY—PHYSIOGRAPHY. An Introduction to the Study of Nature. By Professor HUXLEY, F.R.S. With numerous Illustrations, and Coloured Plates. New and Cheaper Edition. Crown 8vo. 6*s.*

OLIVER (Professor)—FIRST BOOK OF INDIAN BOTANY. By DANIEL OLIVER, F.R.S., F.L.S., Keeper of the Herbarium and Library of the Royal Gardens, Kew, and Professor of Botany in University College, London. With numerous Illustrations. Extra fcap. 8vo. 6*s.* 6*d.*

"It contains a well-digested summary of all essential knowledge pertaining to Indian Botany, wrought out in accordance with the best principles of scientific arrangement."—*Allen's Indian Mail.*

PARKER and BETTANY—THE MORPHOLOGY OF THE SKULL. By Professor PARKER and G. T. BETTANY. Illustrated. Crown 8vo. 10*s.*

Other Volumes of these Manuals will follow.

MACMILLAN AND CO., LONDON.

LATEST EDITION OF GANOT'S PHYSICS.
In large crown 8vo, illustrated by 4 Coloured Plates and 844 Woodcuts, price 15*s.*, cloth.

ELEMENTARY TREATISE on PHYSICS,

Experimental and Applied, for the use of Colleges and Schools. Translated and Edited, with the Author's sanction, from GANOT'S "Éléments de Physique" by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College, Sandhurst. Ninth Edition, Revised and Enlarged.

"This well-known work has been before the public for sixteen years, and has now reached a ninth edition. Each new edition has contained both additions and revisions in accordance with the progress of science. The present edition differs from the last by an increase of subject-matter of twenty-five pages, while twenty-four new illustrations have been added. The illustrations are extremely good, and the various subjects are discussed with a sufficient infusion of mathematics to make the book serviceable for the use of the highest forms in schools and for scholarship and other examinations."—*Academy.*

By the same Translator, in crown 8vo, price 7*s.* 6*d.*

GANOT'S NATURAL PHILOSOPHY for

GENERAL READERS and YOUNG PERSONS. Third Edition, Revised, with a Coloured Plate and 454 Woodcuts.

London: LONGMANS & CO.

Just Published (Second Edition) demy 8vo, 34 pp., price Sixpence.

A LECTURE on some PROPERTIES and PECULIARITIES of WATER: A Chapter in Natural Theology.

By J. M. WILSON, M.A., F.R.A.S.,

Late Fellow of St. John's College, Cambridge; Head Master of Clifton College; and late Mathematical Master of Rugby School.

Delivered before the Nottingham Literary and Philosophical Society, 22nd of March, 1877, in the Mechanics Hall, and published at the request of the President.

London: WHITTAKER & CO.
Rugby: A. J. LAWRENCE (late BILLINGTON).

CHEMISTRY: a TREATISE ON.

By Prof. ROSCOE, F.R.S., and Prof. SCHORLEMMER, F.R.S., of Victoria University, Owens College, Manchester. With Illustrations, &c. Vols. I. and II. Inorganic Chemistry.

Vol. I. The NON-METALLIC ELEMENTS. 21s.
Vol. II. Part 1.—METALS. 18s.
Vol. II. Part 2.—METALS. 18s.
Vol. III. ORGANIC CHEMISTRY. [*In the press.*

"It would be difficult to praise this most valuable Manual too highly. . . . . . The arrangement is clear and scientific; the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid."—*Lancet.*

"A most valuable contribution to the literature of chemistry. . . . . . The work when finished will afford the most complete systematic exposition of the existing state of chemical science that has yet appeared in the English language."—*Nature.*

By Prof. ROSCOE, F.R.S.

LESSONS IN ELEMENTARY CHEMISTRY; Inorganic and Organic. With numerous Illustrations. New Edition. Fcap. 8vo. 4*s.* 6*d.*

PRIMER OF CHEMISTRY. With Illustrations. 18mo. 1*s.*

By Prof. SCHORLEMMER, F.R.S.

THE CHEMISTRY OF THE CARBON COMPOUNDS; or, Organic Chemistry. With Illustrations. 8vo. 14*s.*

"Must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., London.

GEOLOGY AND MINERALOGY.

IN the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE WRIGHT, MINERALOGIST, 90, Great Russell Street, W.C.

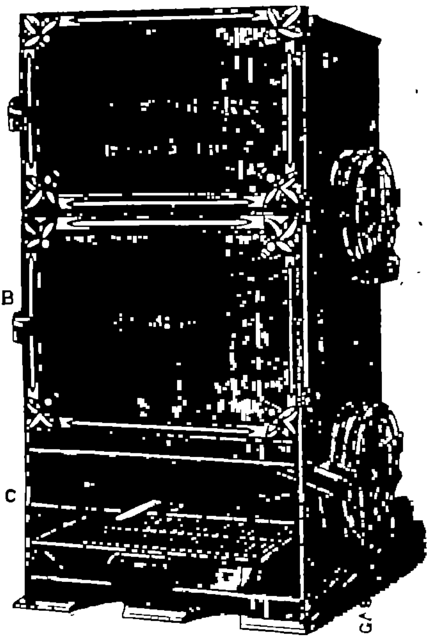
FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).



It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture By Prof Stokes, Sec R S. 6th April, 1881

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena By Lieut.-General Strachey, R.E , C S.I , F R S 8th April

Two Lectures on the Connection between Solar and Terrestrial Phenomena. By Prof. Balfour Stewart, F R S. 27th and 29th April.

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. Norman Lockyer, F.R.S 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics. By Capt. Abney, R E., F R S. 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m on the days stated above

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the Secretary, Science and Art Department, South Kensington, S W.

SOCIETY FOR THE ADVANCEMENT OF CHEMICAL INDUSTRY.

A Meeting for the purpose of forming a Society for the Advancement of Chemical Industry will be held on MONDAY, April 4th, 1881, in the rooms of the Chemical Society, Burlington House, Piccadilly, London, W., at 4 p.m.

Prof Roscoe, F.R.S , President of the Chemical Society, will occupy the chair.

All persons interested in the Chemical Industries are hereby invited to attend.

GEORGE E DAVIS, Hon Sec *pro tem.*

THE ENDOWMENT OF RESEARCH.

The ASTRONOMER-ROYAL, in a Letter of much import addressed by him to Captain W. NOBLE on the 10th inst , wrote as follows —

"The very utmost, in my opinion, to which the State should be expected to contribute is exhibited in the large Grants entrusted to the Royal Society. The world, I think, is not unanimous in believing that THEY have been useful."

"THE PROCEEDINGS" and "THE PHILOSOPHICAL TRANSACTIONS OF THE ROYAL SOCIETY" contain many elaborate Papers with details of painful Experiments upon Animals for Scientific Purposes These practices extend over a long series of years down to the present generation They are as much wanting in real Humanity and true Wisdom as, perhaps, they ever were Which is asserting much, for two great Surgeons of distinguished ability and learning have said of the ROYAL SOCIETY —"Their old and favourite experiment, so often repeated by Hooke, Croone, and others, before our ROYAL SOCIETY, viz., of blowing up the lungs of a Dog, and then compressing them, is good for nothing"

> "Hujusmodi doctrinas bene adumbravit fabula
> de Ixione, qui cum Junonis, potentiae deae,
> concubitum animo sibi designaret, cum
> evanida nube rem habuit; ex qua Centauros
> et Chimaeras progenuit."
>
> Francisci Baronis de Verulamio.

SOCIETY for the TOTAL ABOLITION and UTTER SUPPRESSION of VIVISECTION.

Honorary Secretary and Treasurer,

GEORGE R. JESSE, Esq ,

Henbury, near Macclesfield, Cheshire.

February, 1881.

SILVERED GLASS SPECULA.

JOHN BROWNING begs respectfully to inform the scientific public that he can supply Specula from 3½ in. to 18 in. diameter, of Mr. With's parabolising. The stock is composed of the choicest reserves of the last ten years of Mr. With's productions, and Mr. With's Specula are generally admitted to be the finest ever made.

Each Mirror bears Mr. With's signature.

A reduced Price List of Specula, *Mounted or Unmounted*, will be forwarded post free.

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government, the Royal Society, the Royal Observatories of Greenwich and Edinburgh, and the Observatories of Kew, Cambridge, Durham, Utrecht, Melbourne, &c., &c.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh.

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

LA SEMAINE FRANÇAISE: a Weekly

Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Français pour

l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s. 2d.; six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—

"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—

"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

In fcap. 8vo, price 3s. 6d.

SOUND: ELEMENTARY LESSONS ON.

By DR. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

Burlington House. WALTER WHITE, Assistant Secretary, R.S.

Just Published, price 2s. 6d.

An ELEMENTARY COURSE of PRACTICAL PHYSICS. By A. M. WORTHINGTON, M.A., F.R.A.S., Assistant Master at Clifton College.

RIVINGTONS, Waterloo Place, Pall Mall, London.

CHEMISTRY: a TREATISE ON. By Prof. ROSCOE, F.R.S., and Prof. SCHORLEMMER, F.R.S., of Victoria University, Owens College, Manchester. With Illustrations, &c. Vols. I. and II. Inorganic Chemistry.

Vol. I. The NON-METALLIC ELEMENTS. 21s.
Vol. II. Part 1.—METALS. 18s.
Vol. II. Part 2.—METALS. 18s.
Vol. III. ORGANIC CHEMISTRY. [*In the press.*

"It would be difficult to praise this most valuable Manual too highly. . . . . The arrangement is clear and scientific; the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid."—*Lancet.*

"A most valuable contribution to the literature of chemistry. . . . . The work when finished will afford the most complete systematic exposition of the existing state of chemical science that has yet appeared in the English language."—*Nature.*

By Prof. ROSCOE, F.R.S.

LESSONS IN ELEMENTARY CHEMISTRY; Inorganic and Organic. With numerous Illustrations. New Edition. Fcap. 8vo. 4s. 6d.

PRIMER OF CHEMISTRY. With Illustrations. 18mo. 1s.

By Prof. SCHORLEMMER, F.R.S.

THE CHEMISTRY OF THE CARBON COMPOUNDS; or, Organic Chemistry. With Illustrations. 8vo. 14s.

"Must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., London

GEOLOGY AND MINERALOGY.

In the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE WRIGHT, Mineralogist, 90, Great Russell Street, W.C.

With Illustrations and Maps, medium 8vo, 18s.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific problems of our time."—*Times.*

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

"MACMILLAN'S BIOGRAPHICAL SERIES." NEW VOLUME.

CATHERINE AND CRAUFURD TAIT, WIFE AND SON OF ARCHIBALD CAMPBELL, ARCHBISHOP OF CANTERBURY: a Memoir. Edited, at the request of the Archbishop, by the Rev. W. BENHAM, B.D., Vicar of Marden, and one of the Six Preachers of Canterbury Cathedral. With Two Portraits engraved by JEENS. New and Cheaper Edition. Crown 8vo. 6*s.*

GUIDE TO THE UNPROTECTED. In Every-day Matters relating to Property and Income. By a BANKER'S DAUGHTER. Fifth Edition revised. Extra fcp. 8vo. 3*s.* 6*d.*

ENGLISH MEN OF LETTERS. Edited by JOHN MORLEY. New Volume. Crown 8vo. 2*s.* 6*d.*

DRYDEN. By GEORGE SAINTSBURY.

NEW NOVEL BY HENRY JAMES, Jun.

WASHINGTON SQUARE: THE PENSION BEAUREPAS: A BUNDLE OF LETTERS. 2 vols. Crown 8vo. 21*s.*

"To me it is unquestionably Mr. James's best book. . . . It is brimful of wit and sparkle, of tact and cleverness and humour, of fun, and knowledge of life and of the world, of tact, measure, and resource."—*Truth.*

NEW NOVEL, A STORY OF THE GREEK WAR.

LOUKIS LARAS; or, the Reminiscences of a Chiote Merchant during the Greek War of Independence. From the Greek of D. BIKÉLAS. Translated, with Introduction on the Rise and Development of Modern Greek Literature, by J. GENNADIUS, late Chargé-d'Affaires at the Greek Legation in London. Crown 8vo. 7*s.* 6*d.*

"Mr. Bikélas is a kind of Greek Erckmann-Chatrian, he paints the manners of country people. . . . The description of the life in Chios, of the approach of the Turkish Fleet, of the flight to the old defenceless tower, are most vivid and full of simple force."—*Pall Mall Gazette.*

MACMILLAN AND CO., LONDON, W.C.

Every Saturday. Price 6d.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No 596, Vol. 23] THURSDAY, MARCH 31, 1881 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

SOCIETY FOR THE ADVANCEMENT OF CHEMICAL INDUSTRY.

A Meeting for the purpose of forming a Society for the Advancement of Chemical Industry will be held on MONDAY, April 4th, 1881, in the rooms of the Chemical Society, Burlington House, Piccadilly, London, W., at 4 p.m.

Prof. Roscoe, F.R.S., President of the Chemical Society, will occupy the chair.

All persons interested in the Chemical Industries are hereby invited to attend.

GEORGE E. DAVIS, Hon. Sec *pro tem.*

UNIVERSITY COLLEGE, NOTTINGHAM.

The Town Council of Nottingham have resolved to APPOINT FOUR PROFESSORS as follows:—

ONE PROFESSOR who shall undertake one or more of the following Subjects:—Classics, Literature, History, Political Philosophy, Moral Science; and

THREE PROFESSORS who shall each undertake one or more of the following Subjects:—Mathematics (including Theoretical and Applied Mechanics), Physics, Chemistry, Physiology, Biology, Geology.

The work of the College will be divided into Four Departments, whose arrangement will depend to some extent on the subjects undertaken by the Professors elected, but it is intended that the three Scientific Departments shall severally comprehend—

1. Mathematics and Mechanics,
2. Chemistry,
3. Natural Science,

and that the subject of Physics shall be placed as a subject of principal importance in one or other of those Departments.

Applicants are invited to specify the Subjects which they would be prepared to undertake. Applications for the above Appointments to be addressed to the Town Clerk, Municipal Offices, Nottingham, endorsed "University College," on or before the 7th day of May next. Particulars of Salaries, Duties, and Conditions will be sent upon application to the Town Clerk.

Candidates are especially requested to abstain from canvassing.

SAM. GEO. JOHNSON, Town Clerk,

Municipal Offices, Nottingham, 22nd March, 1881.

THE COUNCIL OF FIRTH COLLEGE,

SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classics, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

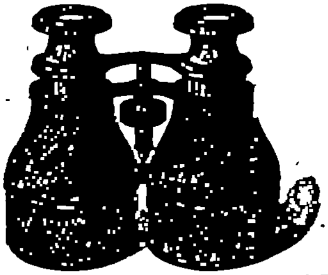
Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

BROWNING'S BINOCULARS.



The "Panergetic" Opera, Field, and Race Glass,

For general use, brilliant light, extensive field of view, and sharp definition.

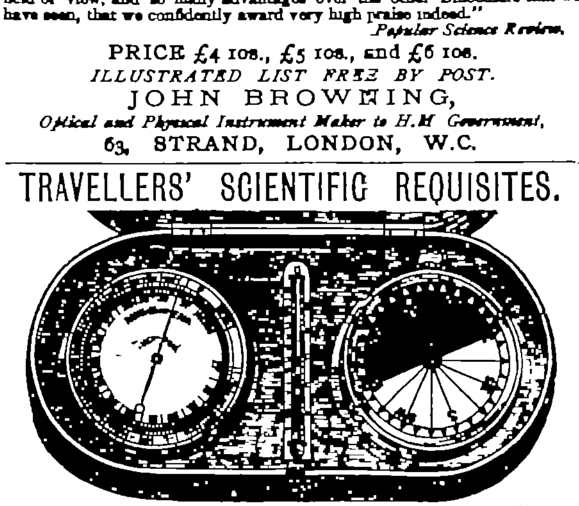
"Brings out figures with marvellous distinctness, and has a very large field of view, and so many advantages over the other Binoculars that we have seen, that we confidently award very high praise indeed."
Popular Science Review.

PRICE £4 10s., £5 10s., and £6 10s.

ILLUSTRATED LIST FREE BY POST.

JOHN BROWNING,
Optical and Physical Instrument Maker to H.M. Government,
63, STRAND, LONDON, W.C.

TRAVELLERS' SCIENTIFIC REQUISITES.



Aneroid Barometer with Altitude Scale, Thermometer and Compass in Flat Pocket Case, various Forms,

£7 7s. and £8 8s.

Price Lists of Instruments free by post.

NEGRETTI & ZAMBRA,
Opticians and Scientific Instrument Makers
To Her Majesty the Queen,
HOLBORN VIADUCT,
45, CORNHILL, & 122 REGENT STREET, LONDON.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48a, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture. By Prof. Stokes, Sec. R.S. 6th April, 1881.

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena. By Lieut.-General Strachey, R.E., C.S.I., F.R.S. 8th April.

Two Lectures on the Connection between Solar and Terrestrial Phenomena. By Prof. Balfour Stewart, F.R.S. 27th and 29th April.

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. Norman Lockyer, F.R.S. 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics. By Capt. Abney, R.E., F.R.S. 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m. on the days stated above.

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the Secretary, Science and Art Department, South Kensington, S.W.

LONDON UNIVERSITY, ARMY, CIVIL SERVICE.

Dr. R. H. JUDE, D.Sc. (Lond.), M.A. (Cantab.), High Wrangler, First Class Natural Science Tripos, late Scholar of Christ's and sometime Demonstrator of Chemistry at Caius College, Cambridge, with qualified Assistants, prepares Gentlemen in all the subjects for the above Exams.

Natural Science treated both experimentally and theoretically.

Highest Testimonials and References to present and former Pupils. A few Pupils taught by Correspondence. Special Classes now forming for Matriculation, B.A., B.Sc., and Prel. Sci.

119, Cambridge Gardens, Notting Hill, W.

ROYAL POLYTECHNIC.—CLASSES for the Preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

B.A. (High Honours), F.L.S., requires a SCIENTIFIC POST. Exceptional References.—Address B.A., Nature Office.

INSTRUCTION IN MATHEMATICS.— Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

WANTED.—NATURE at HALF PRICE, three or four days after publication. A Permanency probable.—Address P. E., care of Messrs. Dawson and Sons, 121, Cannon Street, London, E.C.

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price *7s. 6d.*

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful Lens, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust.—THOMAS J. DOWNING, Geologist, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers the Marine Polyzoa, *Bowerbankia imbricata*, with drawing and description. He has also sent out *Alcyonidium polyoum, Triticella pedicellata, Pedicellina cernua, Syncoryne eximia*, Zoea Stage of *Carcinus maenas*, also a very rich Collection of Free-swimming Fresh-water Rotifers, with *Pandorina morum* and Diatoms, &c. Dutch Frogs, *Rana esculenta*, One Shilling each.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

GEOLOGY AND MINERALOGY.

Special Collections for Teachers and Students, used with success by all Lecturers and Teachers of Geology in Great Britain. Obtained Gold and Bronze Medals at Sydney Exhibition, 1879, also in London, 1862, and Paris 1867.

	£	s.	d.
200 Specimens in Cabinet	2	2	0
100 ditto ditto	1	1	0
50 ditto ditto	0	10	6

New Lists of Collections, Apparatus, &c., now ready, and free on application to

JAMES R. GREGORY'S
Geological Museum and Repository,
88, CHARLOTTE STREET, FITZROY SQUARE.

MINERALOGY AND GEOLOGY.

MAGNIFICENT DERBYSHIRE FLUOR SPAR VASE. Height, with Pedestal, 2ft. 8in.; Diameter 13½in. This is, with one exception, the finest vase of the kind known, the vein having been worked out some forty years ago.

FINE PINK APOPHYLITE, EISENROSE, CONNELLITE, CALC SPAR, BARYTA, FAHLERZ, LIBETHENITES.

COLLECTIONS FOR STUDENTS, from £1 1s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113a), STRAND, LONDON, W.C.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. Harting, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

"The leading Farmers' paper."—Clare Sewell Read, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by John T. Carrington,
With the Assistance of
Frederick Bond, F.Z.S. | John A. Power, M.D.
Edward A. Fitch, F.L.S. | J. Jenner Weir, F.L.S.
F. Buchanan White, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous Woodcut Illustrations, to the printing of which especial attention is given, and occasional Lithographed and Chromo-Lithographed Plates.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

T. Way, F.C.S.

Secretary—C. E. Groves, F.C.S. Offices—Somerset-house-terrace, W.C.

The Institute has been established to ensure that consulting and analytical chemists are duly qualified for the proper discharge of the duties they undertake by a thorough study of chemistry and allied branches of science, in their application to the arts, public health, agriculture, and technical industry.

The Members of the Institute are divided into two grades, having the distinguishing ranks or degrees of Fellow and Associate respectively.

In the case of a Fellow, the Council requires that the Candidate should have been admitted to the Institute as an Associate, and that since his admission and for a period of three years therefrom he should have been continuously engaged in the study and practical work of Applied Chemistry in a manner satisfactory to the Council

In the case of Associates the present regulations require every applicant for admission to this grade to submit to a stringent examination in practical chemistry, and to show to the satisfaction of the Council that he has passed through a course of three years' study of theoretical and analytical chemistry, physics, and elementary mathematics An Associate must be at least 21 years of age before admission, and is not eligible for the higher rank of Fellow until he has been continuously engaged for three years in the study and practical work of Applied Chemistry, in a manner that shall be considered satisfactory by the Council.

NAMES OF FELLOWS.

Abel, F A., C B., F.R S., F C S., Royal Arsenal, Woolwich, S E.

On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

A TEXT-BOOK OF THE
PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY,
INCLUDING
AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.

By ARTHUR GAMGEE, M.D., F.R.S.,
Professor of Physiology in the Victoria University, the Owens College, Manchester.

LONDON: MACMILLAN AND CO.

This work, of which the first volume is now published, and of which the second and concluding volume will be published in 1881, aims at giving a more complete account of the present state of physiological and pathological chemistry than is to be found in any of the existing text-books. The special features of the work are the following:—

First.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of the pure chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a biological question. The classification adopted is, however, based upon physiological and pathological rather than chemical considerations.

Secondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those methods of research which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are given of methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the most important to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired to science, but wishful himself to extend her boundaries. Methods of analysis are described with great care, so as to render the work a trustworthy laboratory guide for the student of physiological chemistry and the practical physician.

Thirdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making researches being given, and the full titles of nearly all papers quoted being given.

Fourthly.—The work is copiously illustrated, the illustrations being in many cases original.

Fifthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary tissues of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal processes.

THE BREWERS' GUARDIAN:
A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.
REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.
The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 16s. 6d. per annum, post free, dating from any quarter-day. Single Copies 1s. each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

NORTH BRITISH AGRICULTURIST
is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

Now publishing in Crown 8vo, price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

EDITED BY JOHN MORLEY.

JOHNSON. By Leslie Stephen.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. Hutton.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. Morison.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. Symonds.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. Huxley, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By William Black.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. Minto.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal Shairp.

"None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the Dean of St. Paul's.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By Anthony Trollope.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By John Morley.

"Perhaps the best criticism yet published on the life and character of Burke is contained in Mr. Morley's compendious biography. His style is vigorous and polished, and both his political and personal judgment, and his literary criticisms, are just, generous, subtle, and in a high degree interesting."—*Saturday Review.*

MILTON. By Mark Pattison.

"Every page gives us something new to learn, or something old put in such a way as to be almost equivalent to that which is new."—*Academy.*

HAWTHORNE. By Henry James, Jun.

"Probably no one living could have done so good a book on Hawthorne as Mr. James has done."—*Saturday Review.*

SOUTHEY. By Prof. Dowden.

"A truly scholarly and delightful monograph of a great writer, who has been of late years undeservedly neglected."—*Examiner.*

CHAUCER. By A. W. Ward.

"An enjoyable and excellent little book is this of Prof. Ward's. Far away the best connected account of Chaucer and his work to be found in English."—*Academy.*

COWPER. By Goldwin Smith.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

BUNYAN. By J. A. Froude.

"The life and character of Bunyan stands out in bold relief, and for the first time the author of the 'Pilgrim's Progress' is portrayed as he really existed."—*Westminster Review.*

BYRON. By John Nichol.

"Decidedly one of the most careful and valuable of the whole series. When a book is so good as Prof. Nichol's, there is little to be said about it, except to recommend it as widely as may be."—*Athenæum.*

LOCKE. By T. Fowler.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

POPE. By Leslie Stephen.

"The sketch of Pope's life which Mr. Leslie Stephen has written is interesting throughout. . . . A work which one can only lay down with the wish to have a good deal more on the same subject by the same hand."—*Academy.*

WORDSWORTH. By F. W. H. Myers.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it. . . . Possibly the best chapter in the book—every chapter of which is excellent—is that on Natural Religion."—*Academy.*

DRYDEN. By George Saintsbury.

⁂ Other Volumes to follow.

MACMILLAN AND CO., BEDFORD STREET, COVENT GARDEN, W.C.

With Illustrations and Maps, medium 8vo, 18*s*.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific problems of our time."—*Times*.

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette*.

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum*.

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette*.

MACMILLAN AND CO., LONDON.

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21*s*.

Just ready. 44 pages 8vo. 1*s*.

CORRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature*.

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register*.

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy*.

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum*.

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic*.

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory*.

Office: 29, BEDFORD STREET, STRAND.

BRITISH ASSOCIATION
FOR THE
ADVANCEMENT OF SCIENCE,
22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at YORK, commencing on WEDNESDAY, August 31.

President-Elect.
SIR JOHN LUBBOCK, Bart., M.P., D.C.L., LL.D., F.R.S., F.L.S., F.G.S.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare beforehand an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Committee request that he will send it, together with the original Memoir, by post, on or before August 1, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section ...." Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the Secretaries in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the General Secretaries, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is given in before the conclusion of the Meeting.

G. GRIFFITH, Acting-Secretary.

LIVERPOOL ROYAL INFIRMARY
SCHOOL OF MEDICINE.

TWO ENTRANCE SCHOLARSHIPS of £11, for two years, will be awarded in October next to such applicants as have taken the highest position in the Honours Division at either of the Matriculation Examinations of London University of the year.

Apply to the Registrar, Dr. Caton, 18a, Abercromby Square, Liverpool.

BROWNING'S BINOCULARS.

THE NEW THREE-POWER GLASS.
VERY POWERFUL.

By turning a stud, the eye-pieces are made changeable at pleasure, so that the glass becomes suitable for either *theatre, field, or marine* purposes. The arrangement is so strong and simple that it cannot get out of order, nor can the eye-pieces be lost.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48B, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr Gillespie.

W. M. ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL.

SUMMER SESSION, 1881.

Lectures and Clinical Instruction in the Wards will commence on May 2nd.

Gentlemen can enter to any one Course or to Hospital Practice only.

TWO ENTRANCE SCHOLARSHIPS, of the annual value of £25 and £20 respectively, tenable for two years, and a SCIENCE SCHOLARSHIP value £50, will be offered for competition at the beginning of the Winter Session.

For Prospectus, containing particulars as to other Scholarships, Resident Appointments, Fees, &c., apply to the Dean or the Resident Medical Officer, at the Hospital.

ANDREW CLARK, Dean.

UNIVERSITY COLLEGE, NOTTINGHAM.

The Town Council of Nottingham have resolved to APPOINT FOUR PROFESSORS as follows:—

ONE PROFESSOR who shall undertake one or more of the following Subjects:—Classics, Literature, History, Political Philosophy, Moral Science; and

THREE PROFESSORS who shall each undertake one or more of the following Subjects:—Mathematics (including Theoretical and Applied Mechanics), Physics, Chemistry, Physiology, Biology, Geology.

The work of the College will be divided into FOUR DEPARTMENTS, whose arrangement will depend to some extent on the subjects undertaken by the Professors elected, but it is intended that the three Scientific Departments shall severally comprehend—

1. Mathematics and Mechanics,
2. Chemistry,
3. Natural Science,

and that the subject of Physics shall be placed as a subject of principal importance in one or other of those Departments.

Applicants are invited to specify the Subjects which they would be prepared to undertake. Applications for the above Appointments to be addressed to the Town Clerk, Municipal Offices, Nottingham, endorsed "University College," on or before the 7th day of May next. Particulars of Salaries, Duties, and Conditions will be sent upon application to the Town Clerk.

Candidates are especially requested to abstain from canvassing.

SAM. GEO. JOHNSON, Town Clerk.

Municipal Offices, Nottingham, 22nd March, 1881.

THE COUNCIL OF FIRTH COLLEGE,

SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classics, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The [illegible] of three gentlemen to whom references may be made should be given, but [illegible] testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers a Collection of Free-swimming Rotifers, including *Anuræa aculeata*, *Brachionus urceolaris*, and several others, with *Pandorina morum* and Diatoms. He has also sent out Anacharis thickly encrusted with tube-dwelling Rotifers, including *Melicerta ringens*, *Limnias ceratophylli*, *Floscularia cornuta*, and Œcistes, also Green Stentors and Hydra, with the curious Vorticellida *Trichodina pediculus* commensal upon them.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

"THE ENDOWMENT OF RESEARCH."

See Front Page of NATURE of March 24.

Letter from the Rev THOMAS P. KIRKMAN, M.A., F R.S., &c.

"Croft, near Warrington, March 11, 1881.

"MY DEAR SIR,—Many thanks for your Fifth Report. I have read it and the inclosed papers with great pleasure.

"I wish you could get some Medical Man to look through the various papers of the Vivisectors, and bring out the evidence that abounds therein—that they have *no clear question proposed* for solution. They are groping, not for answers to scientific questions, but for hints how to frame definite questions. What a horrible thing it is that after three thousand years of carving living men and animals (they Vivisected slaves innumerable as long as they dared), they have really nothing to show for a result, except that Dr. B. has always found it easy and glorious to prove that Dr A. was a dreaming blunderer; while neither B. nor A. ever yet had a sensible question before him which he could show likely to be solved by Vivisection. The Public are, as their Fathers ever were, under the false impression that these gentlemen have Benevolent and Scientific Aims. I don't believe it for all their Latin and Greek compounds. They carve away in the vain hope that something new will turn up for them to shine about, while hitherto they have discovered nothing which they could not find or infer from anatomy and lawful study of health and disease. Any scientific thinker can satisfy himself of the truth of my remarks by a logical examination of their papers.

"Sincerely yours,

"THO. P. KIRKMAN.

"P.S.—You have given a capital account of all your antagonists.

"G. R. JESSE, Esq,
"Henbury, near Macclesfield."

SOCIETY for the TOTAL ABOLITION and UTTER SUPPRESSION of VIVISECTION.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. Harting, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology: habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts

JOHN VAN VOORST, 1, Paternoster Row

In unserem Verlage erscheint:

DER NATURFORSCHER.

Wochenblatt zur Verbreitung der Fortschritte in den Naturwissenschaften.
Herausgegeben von Dr. Wilhelm Sklarek.
Wochentlich 1—1½ Bgn. in 4°.
Preis vierteljährlich 4 Mk.

Die nunmehr ihren XIV. Jahrgang beginnende Zeitschrift hat bei Allen, welche sich mit Naturwissenschaften beschäftigen, grossen Beifall gefunden
Probenummern sind durch jede Buchhandlung zu erhalten
Berlin, S.-W., 77, Charlottenstr.

FERD. DÜMMLER'S VERLAGSBUCHHANDLUNG
(Harrwitz & Gossmann.)

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
Established 1843.

Now publishing, in Crown 8vo. Price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold.

WORDSWORTH. By F. W. H. MYERS.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof NICHOL.

"Decidedly one of the most careful and valuable of the whole series."—*Athenæum.*

POPE. By LESLIE STEPHEN.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette*

COWPER By GOLDWIN SMITH.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

CHAUCER. By Prof. A. W. WARD.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings"—*Athenæum.*

DEFOE. By W. MINTO.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.

". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

*** *Others in Preparation.*

MACMILLAN AND CO., LONDON.

Now Ready.

ZOOLOGICAL SOCIETY'S PUBLICATIONS.

PROCEEDINGS of the SCIENTIFIC MEETINGS of the SOCIETY for 1880. Part IV., concluding the Volume, containing the Papers read at the Scientific Meetings in November and December, 1880. With 13 Plates, mostly coloured, 12s., with Plates uncoloured, 3s.

TRANSACTIONS OF THE SOCIETY.

Vol. XI., Part 3, price 30s., containing—

Mr. F. Moore, On the Genera and Species of the Lepidopterous Sub-Family Ophiderinæ inhabiting the Indian Region. With 3 Coloured Plates.

Mr. W. K. Parker, F.R.S., On the Structure of the Skull in the Chameleons. With 5 Plates.

Vol. XI., Part 4, price 10s., containing—

Mr. W. A. Forbes, On the Male Generative Organs of the Sumatran Rhinoceros (*Ceratorhinus sumatrensis*). With 1 Plate.

Dr. M. Watson, On the Anatomy of the Female Organs of the Proboscidea. With 2 Plates.

These Publications may be obtained at the Society's Office (11, Hanover Square, W.), at Messrs. LONGMANS', the Society's Publishers (Paternoster Row, E.C.), or through any Bookseller.

New Edition, very much enlarged, 21s.

HOW TO WORK WITH THE MICROSCOPE.

By LIONEL S. BEALE, F.R.S.,
President of the Royal Microscopical Society.

THE FIFTH EDITION,

Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.

HARRISON & SONS, Pall Mall.

NEW WORK BY LIONEL S. BEALE.

New ready, pp. 230, demy 8vo, 5s.

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.

By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.,
Professor of the Principles and Practice of Medicine in King's College, London.

J. & A. CHURCHILL, New Burlington Street.

THE CHEMICAL NEWS AND JOURNAL OF PHYSICAL SCIENCE.

EDITED BY W. CROOKES, F.R.S., &c.

Published every Friday. Price 4d.

No. 1115 (April 8th, 1881) contains—Estimation of Fat in Milk, by W. M. Hamlet, F.C.S.—Estimation of Peroxide of Hydrogen, by C. T. Kingzett, F.C.S., &c.—Detection of Aniline Colours in Red Wines by Browning's Microspectroscope, by H. Macagno.—Chemistry of Bast Fibres, by E. J. Bevan and C. F. Cross.—New Alkalimetric Indicator, by H. W. Langbeck.—Report on London Water Supply.—Proceedings of Societies.—Notices of Books—Correspondence.—Chemical Notices from Foreign Sources.—Notes and Queries, &c., &c.

London: Boy Court, Ludgate Hill, E.C.

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects. Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least; frequent supplements and drawings. Subscription at any time; preceding numbers of the year furnished subsequently. Price 12s. for twelve months. Advertisements 4d. a line, widely spread by this paper; considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall 28. Edited by W. v. FREEDEN, M.R., Hamburg, Alexander Street, 8.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 16s. 6d. per annum, post free, dating from any quarter-day. Single Copies 1s. each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

GEOLOGY AND MINERALOGY.

IN the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE WRIGHT, MINERALOGIST, 90, Great Russell Street, W.C.

50 Specimens in Cabinet — — — — —	£1 0 0
100 " " — — — — —	2 0 0

Laboratories fitted up Sets of Apparatus as required by the Universities, Colleges, and Schools always ready and kept in stock Professor Feser's Patent Lactoscope for Testing Milk, as recommended by Dr. Voelcker. Description on Application. A Liberal Discount allowed to the Trade.

WESLEY COLLEGE, SHEFFIELD.

(*Affiliated to the London University*, 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A., LL.D.
Second Master, R. SHINDLER, Esq., M.A. (Lond.).
And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is fully adapted to the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for the Universities, training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal and Instrumental Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, and gives Weekly Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

W. LADD & CO.,
SCIENTIFIC INSTRUMENT MANUFACTURERS,
(*By Appointment to the Royal Institution of Great Britain*),
11 AND 12, BEAK STREET, REGENT STREET, W.
BIDWELL'S SELENIUM RHEOSTAT. AND OTHER APPARATUS FOR BELL'S PHOTOPHONE.

With Illustrations and Maps, medium 8vo, 18*s*.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific problems of our time."—*Times.*

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern biological geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

MACMILLAN AND CO., LONDON.

A HANDBOOK OF DOUBLE STARS.

With a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the Measures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., and JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21*s*.

44 pages 8vo. 1*s*.

CORRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

"The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

"This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and painstaking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

"Will be welcomed by all who take an interest in the subject of double stars."—*Academy.*

"The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling that in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of physically connected stars, nor will he be disappointed."—*Athenæum.*

"One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of information of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single observatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is intelligible."—*The English Mechanic.*

"The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the literature of double-star astronomy."—*The Observatory.*

MACMILLAN AND CO., LONDON.

SCIENTIFIC WORTHIES.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 598, Vol. 23] THURSDAY, APRIL 14, 1881 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

NOTICE.

"NATURE"

FOR APRIL 28, 1881,

Will contain a PORTRAIT, Engraved on Steel by the late

C. H. JEENS,

OF

ROBERT WILHELM BUNSEN.

Note.—Advertisements for this number should be sent to the Office as soon as possible.

Office: 29, BEDFORD STREET, STRAND.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E

The SUMMER SESSION will commence on May 2nd Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr Gillespie.

W. M. ORD, M.D., Dean

THE COUNCIL OF FIRTH COLLEGE, SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classics, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

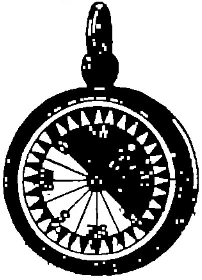
Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

CHEMISTRY.—Instruction given in Analytical and General Chemistry and Microscopy. Apply to the Principal, The Metropolitan Laboratory, 32, Holborn Viaduct, E.C.

BROWNING'S
SELF-LUMINOUS POCKET COMPASSES.



These Compasses are prepared under special arrangement with the Patentees of the Self-Luminous Paint. The dials can be distinctly seen without a light in absolute darkness.

Price, in Gold, with Patent Stop	55s.
,, in Silver	28s. 6d.
,, Large Size, Bronzed	28s. 6d.

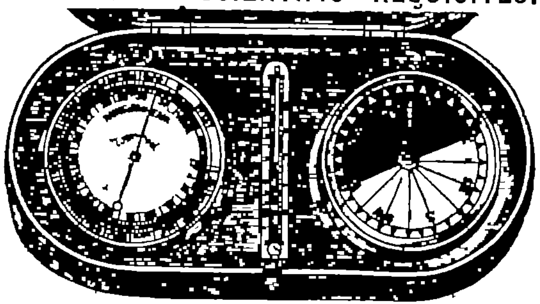
TO BE HAD ONLY OF

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government, &c., &c.,

63, STRAND, LONDON, W.C.

TRAVELLERS' SCIENTIFIC REQUISITES.



Aneroid Barometer with Altitude Scale, Thermometer and Compass in Flat Pocket Case, various Forms,

£7 7s. and £8 8s.

Price Lists of Instruments free by post.

NEGRETTI & ZAMBRA,

Opticians and Scientific Instrument Makers

To Her Majesty the Queen.

HOLBORN VIADUCT,

45, CORNHILL, & 122 REGENT STREET, LONDON.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48A, Tollington Road, Holloway, London, N.

BRITISH ASSOCIATION
FOR THE
ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at YORK, commencing on WEDNESDAY, August 31.

PRESIDENT-ELECT.

SIR JOHN LUBBOCK, BART., M.P., D.C.L., LL.D., F.R.S., F.L.S., F.G.S.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare beforehand an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before August 1, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section……………" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches intrusted to individuals or Committees, must be forwarded to the GENERAL SECRETARIES, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is given in before the conclusion of the Meeting.

G. GRIFFITH, Acting-Secretary.

ROYAL INSTITUTION OF GREAT BRITAIN,

ALBEMARLE STREET, PICCADILLY, W.

LECTURE ARRANGEMENTS AFTER EASTER, 1881.

Lecture-Hour, 3 o'Clock p.m.

Prof. DEWAR, M.A., F.R.S.—Six Lectures on "The Non-Metallic Elements"; on Tuesdays, April 26 to May 31. One Guinea the Course.

Prof. TYNDALL, D.C.L., F.R.S.—Six Lectures on "Paramagnetism and Diamagnetism," on Thursdays, April 28 to June 2. One Guinea.

Prof. H. MORLEY.—Three Lectures on "Scotland's Part in English Literature;" on Saturdays, April 30, May 7, 14 One Lecture on "THOMAS CARLYLE;" on Tuesday, June 7. Half-a-Guinea.

E. C. TURNER, Esq., Lector at the University of St. Petersburg.—Five Lectures on "The Great Modern Writers of Russia;" on Saturdays, May 21, 28, June 4, Thursday, June 9, and Saturday, June 11. Half-a-Guinea.

Subscription (to Non-Members) to all the Courses during the Season, Two Guineas.

ELLEN WATSON MEMORIAL FUND.

It has been decided to found a Prize or Scholarship in Mathematics at University College, London, open equally to Men and Women, as a Memorial of the mathematical genius of the late MISS ELLEN WATSON. More than £600 has been already subscribed in sums varying from £1 to £40. Further Subscriptions will be gladly received, and may be paid to the Hon. Secs. of the Fund—Mrs. W. K. Clifford, 26, Colville Road, Bayswater; or Miss A. M. Palmer, 68, Grosvenor Street, London, W.; or to the account of the Ellen Watson Fund, Messrs. Dimsdale & Co., Bankers, Cornhill, London.

THE MASON SCIENCE COLLEGE, BIRMINGHAM.

APPOINTMENT OF ADDITIONAL PROFESSORS.

Applications for the additional Chairs of Physiology—Geology and Mineralogy, Civil and Mechanical Engineering, Latin and Greek, English Language and Literature, and Lectureships in the French and German Languages (see former Advertisements), must be sent in by the 30th instant, addressed to Mr. G. H. MORLEY, Secretary, The Mason Science College, Birmingham.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.

TWO ENTRANCE SCHOLARSHIPS of £21, for two years, will be awarded in October next to such applicants as have taken the highest position in the Honours Division at either of the Matriculation Examinations of London University of the year.

Apply to the Registrar, Dr. CATON, 18A, Abercromby Square, Liverpool.

ROYAL POLYTECHNIC.—CLASSES for

the Preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers a Collection of Free-swimming Rotifers, including *Anuræa aculeata*, *Brachionus urceolaris*, and several others, with *Pandorina morum* and Diatoms. He has also sent out Anacharis thickly encrusted with tube-dwelling Rotifers, including *Melicerta ringens*, *Limnias ceratophylli*, *Floscularia cornuta*, and Œcistes; also Green Stentors and Hydra, with the curious Vorticellida *Trichodina pediculus* commensal upon them.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

LONDON UNIVERSITY, ARMY, CIVIL SERVICE.

Dr. R. H. JUDE, D.Sc. (Lond.), M.A. (Cantab.), High Wrangler, First Class Natural Science Tripos, late Scholar of Christ's and sometime Demonstrator of Chemistry at Caius College, Cambridge, with qualified Assistants, prepares Gentlemen in all the subjects for the above Exams.

Natural Science treated both experimentally and theoretically.

Highest Testimonials and References to present and former Pupils. A few Pupils taught by Correspondence.

119, Cambridge Gardens, Notting Hill, W.

BRITISH MUSEUM.—The BRITISH

MUSEUM (NATURAL HISTORY), Cromwell Road, South Kensington, will be OPEN to the Public, FREE, on EASTER MONDAY, the 18th of April, and Daily from that date. Hours of Admission as at the British Museum.—EDW. A. BOND, Principal Librarian.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

SCIENCE CLUB,

4, SAVILE ROW, W.

This Club is now open for the use of Members. Annual Subscription: Town Members, £4 4s., Country Members, £3 3s.

A limited number of Members will be admitted without Entrance Fee.

For further information apply to the Honorary Secretary at the Club House.

MINERALOGY AND GEOLOGY.

VERY FINE SPECIMENS of CRYSTALS of BLACK TOURMALINE in ROCK CRYSTAL—MADAGASCAR.

SOME FINE EXAMPLES OF ITACOLUMITE OR FLEXIBLE SANDSTONE—INDIA—IN SLABS 1 FOOT TO 7 FEET 6 INCHES.

BLOWPIPE CASES AND APPARATUS

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,

277 (*Late* 113*a*), STRAND, LONDON, W.C.

VALUABLE COLLECTION OF MINERALS FOR SALE.

JAMES R. GREGORY has now for Sale a very fine Old Collection, chiefly of Cornish Minerals, one of the best in Cornwall. The Collection was commenced forming sixty years ago, and contains most of the old Minerals of the County, many of which have not been found for many years. It consists of over 4000 Specimens, including a large number of Foreign Specimens, and is contained in four large well-made Spanish Mahogany Cabinets, two of thirty drawers each, and two of twenty-four Drawers each, with Bookshelves over. For Price, &c., and to inspect the same, apply to—

JAMES R. GREGORY,

88, CHARLOTTE STREET, FITZROY SQUARE.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price 7s. 6d.

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful Lens, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust.—THOMAS J. DOWNING, GEOLOGIST, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

SELENIUM FROM £10 per Kilogram,

THORITE from £20 per kilogram, is to be had of Dr. S. R. PAIJKULL, Stockholm.

"THE ENDOWMENT OF RESEARCH."

See NATURE *of 7th inst. and March* 24.

In the PROCEEDINGS of the ROYAL SOCIETY for February 18, 1875, No. 159, is a Paper "On the Nature and Physiological Action of the Crotalus Poison as Compared with that of Naja Tripudians and other Indian Venomous Snakes; also investigations into the Nature of the Influence of Naja and Crotalus Poison on Ciliary and Amoeboid Action, and on Vallisneria, and on the influence of Inspiration of Pure Oxygen on Poisoned Animals," by T. LAUDER BRUNTON, M.D., F.R.S., &c., and J. FAYRER, C.S.I., M.D., &c.

The questions proposed in the title for solution by the experiments are as precise as the phrases, "the Nature and Physiological Action of Poison" and "the Nature of the Influence of Poison." They are evidently framed not to explain to the Royal Society at what the investigator was exactly aiming, but so as to admit of any amount of definition which random experiment might fling upon them. The results are honestly given in the first two pages. "We have already expressed" [in former papers] "our belief that death is caused by the Cobra-Daboia and Hydrophis-poison—1st, through its action on the cerebro-spinal nerve centres, especially on the medulla, inducing paralysis of respiration; or, 2nd, in some cases . . . by arrest, tetanically in systole, of cardiac action, probably owing to some action on the cardiac ganglia; 3rd, by a combination of the two previous causes; 4th, by a septic condition of a secondary nature, and which [*sic*] being more essentially pathological in its bearings, the details were not considered suitable for discussion here." Observe that in papers for the Royal Society the Greek and Latin are of primary importance. This sums up the thanatological results of an enormous amount of cruelty in previous experiments. The writer has come before to the belief that death is caused—1st, through action on centres inducing stoppage of breath; 2nd, in some cases by arrest of action, probably owing to some action; 3rd, by a combination of the two; 4th, by a septic condition not suitable for discussion here. The words ending in "*ation*" and "*ition*" are of great scientific weight. Next come the results of the new cruelties detailed in 17 pages. "There is reason to believe that death is caused in the same way by the *Crotalus* poison also . . . But though the actual cause of death is essentially the same" [of course the reader grants that this cause is quite known to the gentleman], "the phenomena which precede and accompany it differ in some degree." Here is the place to look for the new phenomena and results; for in a scientific paper for the Royal Society they are sure to be indicated. What is precisely the "some degree" of difference? There is nothing noted as information to be added to that obtained "from the experiments recently performed in Calcutta by Dr. Ewart and the members of the committee appointed by Government," nothing that I can find, except that vague thing, "a greater tendency." "But we observe (and in this our observations are in accord with those of Weir Mitchell) that there is a greater tendency to both local and general haemorrhage and extravasation of blood and of the colouring matter of the blood . . . than in poisoning by either cobra or viper." . . . There is one thing more about this blood of the dead animal:—"But with regard to the blood itself we have observed that it does form a coagulum after death, generally, if not invariably, as we have noted" [in previous papers] "to be the case" . . . "of animals that have succumbed to the *Daboia*-virus." To this is appended the foot-note: "In Dr. Fayrer's Indian experiments the blood of animals dead from *Daboia*-poison nearly always remained fluid after death." Then follows an account of conclusions of the Calcutta committee about fluidity and coagulation after death. The introduction here finishes, and the experiments begin.

[*To be continued.*]

NEW WORK ON GARDENING.

Next Week will be published, in crown 8vo, cloth, price 6*s.* 6*d.*

EPITOME OF GARDENING.

By THOMAS MOORE, F.L.S., F.R.H.S.,

Curator of the Botanic Garden, Chelsea.

With an Introductory Chapter on the Principles of Horticulture by MAXWELL T. MASTERS, M.D., F.R.S.

Illustrated with upwards of Two Hundred Wood Engravings.

Edinburgh: ADAM & CHARLES BLACK.

WESLEY COLLEGE, SHEFFIELD.

(*Affiliated to the London University,* 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A., LL.D.
Second Master, R. SHINDLER, Esq., M.A. (Lond.).
And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is fully adapted to the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for the Universities, training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal and Instrumental Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, and gives Weekly Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s.*

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO., LONDON.

This Day is Published.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

E. RAY LANKESTER, M.A., F.R.S., F.L.S.,
Fellow of Exeter College, Oxford, and Professor of Zoology and Comparative Anatomy in University College, London,
With the co-operation of
F. M. BALFOUR, M.A., F.R.S., F.L.S.,
Fellow and Lecturer of Trinity College, Cambridge;
W. T. THISELTON DYER, M.A., F.R.S., F.L.S.,
Assistant Director of the Royal Gardens, Kew; and
E. KLEIN, M.D., F.R.S.,
Lecturer on Histology in St. Bartholomew's Hospital Medical School, London.

MEMOIRS.

The Minute Anatomy of the Branchiate Echinoderms. By P. HERBERT CARPENTER, M.A., Assistant-Master at Eton College. With two Plates.

On Young Stages of Limnocodium and Geryonia. By E. RAY LANKESTER, M.A., F.R.S., Jodrell Professor of Zoology in University College, London. With Plate.

The Origin and Significance of the Metamorphosis of Actinotrocha. By EDMUND B. WILSON, Fellow in Biology, Johns Hopkins University. With two Plates.

A Further Contribution to the Minute Anatomy of the Organ of Jacobson in the Guinea-Pig. By E. KLEIN, M.D., F.R.S., Lecturer on Histology and Embryology in the Medical School of St. Bartholomew's Hospital. With two Plates.

Histological Notes. By E. KLEIN, M.D., F.R.S.

On the Development of Certain Microscopic Organisms occurring in the Intestinal Canal. By D. D. CUNNINGHAM, M.B., Surgeon-Major, Indian Medical Service; Fellow of the Calcutta University. With Plate.

Researches upon the Development of Starch-Grains. By A. F. W. SCHIMPER. With Plate.

On the Cause of the Striation of Voluntary Muscular Tissue. By JOHN BERRY HAYCRAFT, M.B., B.Sc., F.R.S.E., Senior Physiological Demonstrator in the University of Edinburgh.

On the Relation of Micro-Organisms to Disease. By JOSEPH LISTER, F.R.S., Professor of Clinical Surgery in King's College, London.

Observations and Reflections on the Appendages and on the Nervous System of *Apus cancriformis*. By E. RAY LANKESTER, M.A., F.R.S., Jodrell Professor of Zoology in University College, London. With Plate.

NOTES AND MEMORANDA.

Claus on Intracellular Digestion in Hydrozoa.
Kent's Manual of the Infusoria.

London: J. & A. CHURCHILL.

Sixth Edition, in Two vols., 8vo, £2 2s.

COOLEY'S CYCLOPÆDIA OF

PRACTICAL RECEIPTS and Collateral Information in the Arts, Manufactures, Professions, and Trades, including Medicine, Pharmacy, Hygiene, and Domestic Economy; designed as a Comprehensive Supplement to the Pharmacopoeia and General Book of Reference for the Manufacturer, Tradesman, Amateur, and Heads of Families. Edited by Prof. Tuson, F.C.S., assisted by several Scientific Contributors.

This Edition exceeds the last by some 600 pages, and contains a greatly-increased number of receipts culled from the most reliable English and foreign journals; numerous articles on Applied Chemistry, Pharmacy, Hygiene, Human and Veterinary Medicine, &c., have been added; many of the old articles are extended; and, where desirable, the text is illustrated by woodcuts.

"We cannot spare space to enumerate all the improvements. Those who have the old edition of this work will do well to supply themselves with its successor; those who have no copy of it will do still better if they purchase this edition."—*Chemist and Druggist.*

"It is a storehouse of scientific knowledge, and will be found valuable in every house."—*Lancet.*

*** *This Work can also be had in 16 Parts, at 2s. 6d. each.*

London: J. & A. CHURCHILL.

Third Edition, Revised and Enlarged, with Forty-eight Engravings, Post 8vo. 7s. 6d.

PRACTICAL AND ANALYTICAL

CHEMISTRY, Specially adapted for Schools and Colleges, and for Beginners. By FRANK CLOWES, D.Sc., Senior Science Master at the High School, Newcastle-under-Lyme.

London: J. & A. CHURCHILL.

Fourth Edition, with nearly Three Hundred Engravings, 8vo. 16s.

CHEMISTRY, INORGANIC AND

ORGANIC. WITH EXPERIMENTS. By CHARLES L. BLOXAM, Professor of Chemistry in King's College, London.

By the SAME AUTHOR. Fourth Edition, with 89 Engravings, crown 8vo. 5s. 6d.

LABORATORY TEACHING; or, Progressive

Exercises in Practical Chemistry.

London: J. & A. CHURCHILL.

Fifth Edition, 8vo, with Engravings. 7s. 6d.

VALENTIN'S QUALITATIVE CHEMICAL ANALYSIS.

Revised and Corrected by W. R. HODGKINSON, Ph.D., Demonstrator of Practical Chemistry in the Science Schools, South Kensington.

London: J. & A. CHURCHILL.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, April 14, 1881.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 599, VOL. 23] THURSDAY, APRIL 21, 1881 [PRICE SIXPENCE

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

"NATURE"

FOR APRIL 28, 1881,

Will contain a PORTRAIT, Engraved on Steel by the late

C. H. JEENS,

OF

ROBERT WILHELM BUNSEN.

NOTE.—Advertisements for this number should be sent to the Office as soon as possible.

Office: 29, BEDFORD STREET, STRAND.

SOCIETY OF CHEMICAL INDUSTRY.

NOTICE is hereby given, in accordance with a resolution unanimously passed at the Inaugural Meeting on April 4th, that all persons connected with Chemical Industries may, for the space of Six Months, become Members of the above Society upon signing the necessary forms, which may be obtained from any of the Secretaries, provided such applicants be considered eligible by the Council, and that they pay a Subscription of One Guinea for the *first* year, after which they shall conform to the bye-laws of the Society.

Members admitted during the first Six Months are exempted from the payment of an Entrance Fee.

The Society is intended to include all who are engaged in any Chemical Industry or in any industry where Chemistry plays a part, and the Secretaries will be glad to give any information on the subject.

Application for Membership may be made to any of the Secretaries, but addressed, care of Mr Thomas Tyrer, Garden Wharf, Battersea, London, S W.

The Council elected at the Inaugural Meeting is constituted as follows:—

President—Prof Roscoe, F.R.S.

Vice-Presidents—F A Abel, Esq, F R S., Lothian Bell, Esq., F.R.S., F. H. Gossage, Esq, G. D. Longstaff, Esq, M D, E. K. Muspratt, Esq, H. Lee Pattinson, Esq, W H Perkin, Esq, F R S, Dr C. W Siemens, F.R.S., Dr. Angus Smith, F R.S, W. Weldon, Esq., F R.S E, Dr. A. W. Williamson, F R S, Jas Young, Esq., F R S

Committee—W. de W. Abney, Esq, R E, F.R S; Alexander Chance, Esq, William Crookes, Esq, F R.S, Dr Chas Graham, Peter Griess, Esq, F.R.S, Dr B Hewitt, Esq, M.D., David Howard, Esq, James Mactear, Esq, John Spiller, Esq., Dr. H. Sprengel, F.R.S., H. Tate, jun, Esq, Philip Worsley, Esq.

Treasurer—E Rider Cook, Esq, East London Soap Works, Bow, E

Secretaries—Hon. General Sec, George E. Davis, Heaton Chapel, Stockport, Hon Metropolitan Sec., Thomas Tyrer, Garden Wharf, Battersea, London, S.W., Hon District Sec., Eustace Carey, Widnes, Hon. Foreign Sec., Ludwig Mond, Winnington Hall, Northwich

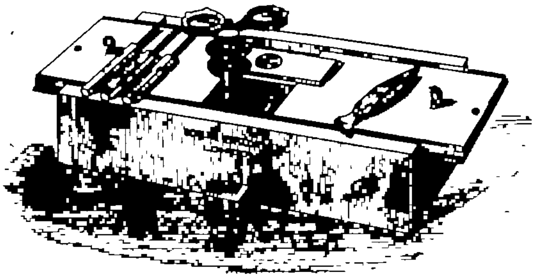
The First General Meeting will be held in London in June next, and due notice of the exact date will be given. At this meeting Papers will be read and matters relating to Chemical Industry discussed.

It is respectfully requested that all those gentlemen present at the Inaugural Meeting who did not append *their* addresses to the roll, and who desire to become Members, will at once communicate with the Hon. Metropolitan Secretary.

Signed, H. E. ROSCOE, President.

April 18th, 1881.

THE HOUSTON BOTANICAL MICROSCOPE.



This ingenious and efficient little instrument provides botanical students with a dissecting microscope at a very low price

It consists of a box contrived so that it will form a dissecting stage, a duplex lens giving 3 powers, 4, 6, and 10 diameters, which can be removed and carried in the pocket, and a brass focussing tube on pillar, a cork slide, a hollowed glass for holding liquids, and a pair of forceps.

PRICE COMPLETE, 6s. 6d.

JOHN BROWNING,
Optical and Physical Instrument Maker to H.M. Government &c., &c.,

Opticians and Scientific Instrument Makers
TO HER MAJESTY THE QUEEN,
HOLBORN VIADUCT,
45, CORNHILL, & 122 REGENT STREET, LONDON.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48B, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL.

SUMMER SESSION, 1881.

Lectures and Clinical Instruction in the Wards will commence on May 2nd.

Gentlemen can enter to any one Course or to Hospital Practice only. TWO ENTRANCE SCHOLARSHIPS, of the annual value of £25 and £20 respectively, tenable for two years, and a SCIENCE SCHOLARSHIP value £50, will be offered for competition at the beginning of the Winter Session.

For Prospectus, containing particulars as to other Scholarships, Resident Appointments, Fees, &c., apply to the Dean or the Resident Medical Officer, at the Hospital.

ANDREW CLARK, Dean.

CITY AND GUILDS OF LONDON INSTITUTE for THE ADVANCEMENT OF TECHNICAL EDUCATION.

VICE-PRESIDENTS.

The Right Hon. Lord SELBORNE, Lord Chancellor, Chairman of Council
F. J. BRAMWELL, Esq., F.R.S., Chairman of Executive Committee.
Sir S. H. WATERLOW, Bart., Ald., M.P., Treasurer.

The Executive Committee are prepared to grant a limited number of

FREE ADMISSIONS

to the Classes in CHEMICAL TECHNOLOGY (Bread-making, Brewing Alkali Trade, Soap, Glass, &c.), in MECHANICAL TECHNOLOGY (Iron and Steel Manufacture, Strength of Materials), under Professors GRAHAM and KENNEDY, at University College; and also to the Classes in METALLURGY (Assaying, Quantitative Blowpipe Analysis, Metals and their Alloys), and in PRACTICAL FINE ART, under Professors HUNTINGTON and DELAMOTTE, at King's College.

In the selection of Candidates preference will be given to Foremen in Chemical Works, Artisans, Apprentices, Designers, and Artistic Tradesmen.

Applications for admission to be sent in the first instance to the Director and Secretary of the City and Guilds of London Institute, from whom, as well as from the Professors at University College and King's College, further particulars can be obtained

PHILIP MAGNUS, Director and Secretary.

Gresham College, E.C.

THE COUNCIL OF FIRTH COLLEGE,

SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classics, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

CHEMISTRY.—Instruction given in Analytical and General Chemistry and Microscopy.

Apply to the PRINCIPAL, The Metropolitan Laboratory, 32, Holborn Viaduct, E.C.

SELENIUM FROM £10 per Kilogram,

THORITE from £20 per kilogram, is to be had of Dr. S. R. PAIJKULL, Stockholm.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers *Trichodina pediculus*, a curious Infusorian found parasitic, or rather commensal, upon the Common Hydra. He has also sent out the Green Trumpet Animalcules, *Stentor polymorphus*, also *Ophrydium longipes*, Volvox, Euglena, Nitella (in fructification), Desmids and Diatoms, Zoea Crabs, and some Marine Hydrozoa and Polyzoa.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

LONDON UNIVERSITY, ARMY, CIVIL SERVICE.

Dr. R. H. JUDE, D.Sc. (Lond.), M.A. (Cantab.), High Wrangler, First Class Natural Science Tripos, late Scholar of Christ's and sometime Demonstrator of Chemistry at Caius College, Cambridge, with qualified Assistants, prepares Gentlemen in all the subjects for the above Exams.

Natural Science treated both experimentally and theoretically.

Highest Testimonials and References to present and former Pupils. A few Pupils taught by Correspondence.

119, Cambridge Gardens, Notting Hill, W.

EXETER SCHOOL.

Chairman of Governors—The LORD BISHOP OF EXETER.

Head-Master—The Rev. EDWARD HARRIS, M.A., late Classical Assistant-Master at Clifton College.

The New School, with Chemical Laboratory, built from the designs of Mr. W. Butterfield, is now in use.

Tuition Fee, £15 to £21, according to age.
Boarding Fee, £50 to £60, " "

There are valuable Scholarships tenable at the School.

Also Exhibitions to the Universities and other places of higher education of the aggregate value of £500 per annum.

Apply to the CLERKS, Messrs. DAW & SON, 13, Bedford Circus, Exeter; or to the HEAD-MASTER, at the School.

NOTICE.—LIVERPOOL.

MR. A. NORMAN TATE, in reply to several inquiries from clients and others, and to avoid further misconception arising from the similarity of his surname and that of one of the principals of another chemical establishment in this city whose announcements of commencement of business have lately appeared, desires to say that his only Office and Laboratories are in Hackins Hey.

The publishers of one magazine, evidently misled by similarity of surname, having mentioned him (as "Mr Norman Tate") as one of the principals of the Liverpool College of Chemistry, he desires to say that he is in no way connected with that establishment, and he has no partner

Analytical Laboratory and School of Technical Chemistry,
7, 8, 9, and 11, Hackins Hey.

ROYAL POLYTECHNIC.—CLASSES for the Preparation of Students for University Examinations,

under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

THREE LARGE MUSEUM WALL,

Cases for Sale, Second-hand, Cheap, Best Glass, 9 feet high, Mahogany, Perfect Fittings.—JOHN METCALFE, Richmond, Yorkshire.

LA SEMAINE FRANÇAISE: a Weekly

Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3*d.*, through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Français pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½*d.*, en timbres poste. Abonnement franco par la poste—un an, 15*s.* 2*d.*, six mois, 7*s.* 7*d.* Prix 3*d.*, chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3*d.* WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3*s.* 9½*d.*; 6 months, 7*s.* 7*d.*; 12 months, 15*s.* 2*d.*

Published by W. PICKERING, 21, Arundel Street, Strand, London, W

"THE ENDOWMENT OF RESEARCH."

See NATURE *of April* 14, 7, *and March* 2

There may be something profound, of which Dr. Brunton has entirely concealed all conception from the Royal Society, in the fact that the same poisoned blood, after death by torture, remains fluid at Calcutta and coagulates in England. We are informed that the *Crotalus*-poison came from Philadelphia, looking like fragments of dried gum-arabic.

In Experiments III. and IV. two full-grown guinea-pigs, of equal weight, were selected, and into their peritoneal cavities, at 1.52 and at 1.56 p.m., were injected *Crotalus* and *Cobra*-poison, one poison for each. Two pages of notes follow, such as those on the former:—"At 2.42. Sluggish; drags the hind-legs. At 2.58. Weaker; rolls partially over on one side, but can run when roused. At 3.7. Can still be roused; abdomen distended and painful; cries out when it is touched, as though peritonitis were setting in. 3.12 Can be roused with difficulty" . . . "can still stagger a few paces, but co-ordination of muscular power much diminished. 3.30. In violent convulsions. 3.38. Convulsions continue." Then death at 3.55, and electrodes and *post-mortem* carving. The other guinea-pig was lucky enough to die in 21 minutes. The null summary compares the effects of the two poisons:—"There were no very marked differences in the action of the poison in these two cases, except in the energy with which the *Cobra* exceeded the *Crotalus*.—*Crotalus:* twitchings; restless; squeaks; sluggish; ataxy; paralysis; hurried respiration; peritonitis; convulsions. Death in 2h. 3m. Coagulated blood; ecchymosis and extravasation of serous effusion well marked; cord paralysed; muscles retain irritability. *Cobra:* Twitchings; excitement; squeaks; sluggish; ataxy; weakness; paralysis; convulsions. Death in 21 minutes. Spinal cord and nerves paralysed; muscles irritable; heart distended; blood congested; ecchymosis; congestion less than in *Crotalus.*" I wonder what definite question is freshly answered or elucidated in all this. It is not pointed out that anything is new, nor that anything is of either theoretical or practical value, in these cruel demonstrations. Five such experiments on guinea-pigs are detailed, all with similar vague results. Then three on rabbits. Then, up to XXVIII., experiments on cats and frogs, comprising vivisections. "Experiment XXVIII. To test the effects of *Cobra*-poison, when swallowed, on the frog. [Can any man assign the exact matter tested?] June 24, 1874. At 2.25 p.m. About one-eighth of a grain of dried *Cobra*-poison was passed down a frog's throat. 2.30. Frog makes violent efforts to vomit; gaping; head thrown back tetanically. 2.34. Bloody mucus vomited with violent efforts"—on which hangs the foot-note:—"This experiment is *especially interesting*, as showing that frogs do occasionally vomit, a fact which has been denied by some physiologists." This, at least, is something new, though not exactly the matter tested. The doctor cleverly places his deadly obstruction on the rails of frog life, and waits behind his tree for the coming smash. Calmly, in that tornado of wreck and agony, he says, "Now for Science!" and picks out his chance discovery. I wonder whether the doctrine that frogs do not vomit cost as much cruelty as this triumphant refutation. "2.50. Moves with difficulty; is becoming paralysed; efforts to vomit continue. 3.0. Much the same. 3.5. Very weak; still tries to vomit. 3.10. Reflex action still well marked." How much torment does that mean? "3.15. Motor nerves apparently quite paralysed. 3.20. Apparent death." Whether it died or no, it did vomit. That immortalises Dr. Brunton. If it does not quite follow that all "frogs do occasionally vomit," this one poisoned and tortured frog did. This page of the *Proceedings* of the Royal Society will never be forgotten. This pet experiment so "*especially interesting*" is talked of already. Was the poison given to the serpent to deaden the pain of its victims, or to enable biologists to inflict random and lingering torture, in order that they may talk Science, which, summed up, amounts to so little, and points the way to less?

[*To be continued.*]

SOCIETY FOR THE TOTAL ABOLITION AND UTTER SUPPRESSION OF VIVISECTION.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

⁂ Upwards of 150,000 Vols. of this series have been sold

WORDSWORTH. By F. W. H. MYERS.
"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.
"In the case of Locke's biographer we venture to say that Mr Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof. NICHOL.
"Decidedly one of the most careful and valuable of the whole series."—*Athenæum.*

POPE. By LESLIE STEPHEN.
"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH.
"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

CHAUCER. By Prof. A. W. WARD.
"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.
"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.
"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.
"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.
"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.
"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.
"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.
"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.
"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.
"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.
"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings"—*Athenæum.*

DEFOE. By W. MINTO.
"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.
". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.
"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.
"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.
"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

⁂ *Others in Preparation.*

MACMILLAN AND CO., LONDON.

Small 8vo, 12s.

ZOOLOGICAL CLASSIFICATION: A Handy-Book of Reference, &c. By FRANCIS P PASCOE, F L S. Second Edition, with Additions and a Glossary.

JOHN VAN VOORST, 1, Paternoster Row.

"We know of no volume which, in the space, contains so much reliable information."—*Nature* (1st Ed.).

"It is rare for any one to go through so much thought and research as is involved in a classification of the genera of the animal kingdom; and rarer for this to be accomplished by a naturalist whose judgment is not thwarted by thraldom to theories"—*Westminster Review* (1st Ed).

"An extremely valuable compendium of zoology."—*Popular Science Review.*

"Notwithstanding the extreme conciseness with which the whole subject is treated, the author generally indicates not only the bare characters by which the different groups are to be distinguished, but also certain interesting points in the structure, habits, or development of the animals comprising them and, not content with merely mentioning the author whose opinion he adopts, usually, in cases of doubt, or where different views are extant, discusses briefly the opinions he has not followed."—*Annals and Magazine of Natural History.*

"We cordially recommend the work as likely to prove of the greatest service as 'a handy-book of reference.'"—*Entomologist's Monthly Magazine.*

New Edition, very much enlarged, 21s.

HOW TO WORK WITH THE MICROSCOPE.

By LIONEL S. BEALE, F.R.S.,
President of the Royal Microscopical Society.
THE FIFTH EDITION,
Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.
HARRISON & SONS, Pall Mall.

NEW WORK BY LIONEL S. BEALE.
Now ready, pp. 230, demy 8vo, 5s.

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.
By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.,
Professor of the Principles and Practice of Medicine in King's College, London.
J. & A. CHURCHILL, New Burlington Street.

This Day is published, super royal 4to, with Six Plates, 10s. 6d.

A MEMOIR of the ECHINODERMATA of the ARCTIC SEA to the WEST of GREENLAND. By P. MARTIN DUNCAN, M.B. (Lond.), F.R.S., F.G.S., F.L.S., and W. PERCY SLADEN, F.G.S., F.L.S., &c.

JOHN VAN VOORST, 1, Paternoster Row.

TEXT-BOOKS OF SCIENCE.
In small 8vo, with 373 Figures on Wood, price 6s. cloth.

SYSTEMATIC MINERALOGY. By HILARY BAUERMAN, F.G.S., Associate of the Royal School of Mines. (Forming one of Messrs. LONGMANS & Co.'s Series of Text-Books of Science, Mechanical and Physical, Edited by C. W. MERRIFIELD, F.R.S.)

London: LONGMANS & CO.

GREEK and ROMAN COINS. Catalogue of the Collection formed by GEORGE SIM, F.S.A. Scot., Edinburgh. 4to, price 21s.

MACMILLAN & CO., LONDON.

Just issued, price 5s., handsomely bound in cloth, with Portrait of Author

MIND IN ANIMALS. By Prof. Ludwig BÜCHNER. Translated by ANNIE BESANT.

"It is a decidedly valuable addition to the literature of Comparative Psychology."—*Nature.*

London: FREETHOUGHT PUBLISHING COMPANY, 28, Stonecutter Street, E.C.

GEOLOGY AND MINERALOGY.

In the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE WRIGHT, MINERALOGIST, [illegible], Great Russell Street, W.C.

50 Specimens in Cabinet — — — — — £1 0 0
100 ,, ,, — — — — — 2 0 0
200 ,, ,, — — — — — 5 0 0
&c., &c.

Price 1s. 3d. Subscription for One Year, payable in advance, 12s.
London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

BLACKS, BOERS, and BRITISH: a Three-Cornered PROBLEM. By F. R. STATHAM. Crown 8vo. 6*s.*

"It is the completest account yet given to the English public of South African politics, but it is that and very much more. It is a picture of South Africa itself. . . . His book shows a complete grasp of the subject and great power of presentation and description."—*Daily News.*

ANTHROPOLOGY: an Introduction to the Study of MAN AND CIVILISATION. By E. B. TYLOR, D.C.L., F.R.S. With numerous Illustrations. Crown 8vo. 7*s.* 6*d.*

"It is an endeavour to put before the lay readers in a clear, condensed, and interesting form the main settled results of modern investigations into the science of man. . . . Mr. Tylor's admirable little book certainly deserves the success with which it will doubtless meet."—*Pall Mall Gazette.*

"It is a most attractive and entertaining introduction to the science of anthropology. . . . His writing is clear and luminous, and his arrangement masterly."—*Saturday Review.*

MANUAL OF ANCIENT GEOGRAPHY. From the German of Dr. H. KIEPERT. Crown 8vo. 5*s.*

"Dr. Kiepert actually succeeds in making ancient geography interesting, connecting it as he is able to do from his extensive and scholarly knowledge with the natural features of the various countries, the movements of various races, and modern conditions. The arrangement is methodical and the treatment clear and well defined, the connection between the Old World and the New being always kept in sight. . . . Altogether the English edition of the Manual will form an indispensable companion to Kiepert's 'Atlas,' now used in many of our leading schools."—*The Times.*

GRAPHICAL DETERMINATION OF FORCES IN ENGINEERING STRUCTURES. By J. B. CHALMERS, C.E. With Illustrations. 8vo. 24*s.*

THE STEAM ENGINE AND ITS INVENTORS: a Historical Sketch. By ROBERT L. GALLOWAY, Mining Engineer. With numerous Illustrations. Crown 8vo. 10*s.* 6*d.*

"Mr. Galloway's capital little book."—*English Mechanic.*

"A book of singular local and general interest."—*Newcastle Weekly Chronicle.*

"We regard it as a valuable addition to engineering literature."—*Colliery Guardian.*

QUESTIONS ON BALFOUR STEWART'S ELEMENTARY LESSONS IN PHYSICS. By Prof. THOMAS H. CORE, Owens College, Manchester. 18mo. 2*s.*

THE COLLECTED WORKS OF FRANCIS SIBSON, M.D. LONDON, F.R.S., &c. Edited by WILLIAM ORD, M.D. With Illustrations. 4 vols., 8vo. £3 3*s.*

THROUGH THE RANKS TO A COMMISSION. Crown 8vo. 6*s.*

"This very interesting and indeed instructive narrative."—*Army and Navy Gazette.*

"This well-written book . . . such a peep behind the curtain has seldom been offered to the public. . . . We have already said enough to show the merits of the book, and we hope to induce the public to read it."—*Athenæum.*

NEW AND REVISED EDITION. VOL. I. OF

THE LIFE OF JOHN MILTON. Narrated in connection with the Political, Ecclesiastical, and Literary History of his Time. By DAVID MASSON, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. Vol. I. New and Revised Edition. 8vo. 21*s.*

Vol. II. 8vo. 16*s.* Vol. III., 8vo. 18*s.* Vols. IV. and V., 8vo. 32*s.* Vol. VI., with Portrait, 8vo. 21*s.*

NOW READY, VOL. II.

THE METAPHYSICS OF THE SCHOOL. By THOMAS HARPER (S.J.). In Five Volumes. Vol. II., 8vo. 18*s.* (Vol. I., 8vo. 18*s.*)

"We can only recommend professors, students, and cultured readers of all sorts to study it and to try to master it."—*Dublin Review.*

MATERIALISM, ANCIENT AND MODERN. By a Late Fellow of Trinity College, Cambridge. Crown 8vo. 2*s.*

NEW PART—XIII. (PLANCHE to RICHTER).

A DICTIONARY OF MUSIC AND MUSICIANS, A.D. 1450-1881. By Eminent Writers, English and Foreign. With Engravings and Woodcuts. Edited by GEORGE GROVE, D.C.L. In Three Volumes. Vols. I. and II. 21*s.* each; Parts I. to XIII. 3*s.* 6*d.* each.

NON-MIRACULOUS CHRISTIANITY AND OTHER SERMONS, preached in the Chapel of Trinity College. By GEORGE SALMON, D.D., Chancellor of St. Patrick's Cathedral, and Regius Professor of Divinity in the University of Dublin. Crown 8vo. 6*s.*

EXERCISES IN ANALYTICAL GEOMETRY. Compiled and arranged by J. M. DYER, M.A., Senior Mathematical Master in the Classical Department of Cheltenham College. Crown 8vo. 4*s.* 6*d.*

MACMILLAN AND CO., LONDON, W.C.

By LIONEL S. BEALE, F.R.S.

President of the Royal Microscopical Society.

THE FIFTH EDITION,

Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.

HARRISON & SONS, Pall Mall

Just issued, price 5s., handsomely bound in cloth, with Portrait of Author

MIND IN ANIMALS. By Prof. Ludwig BÜCHNER. Translated by ANNIE BESANT.

"It is a decidedly valuable addition to the literature of Comparative Psychology."—*Nature.*

London: FREETHOUGHT PUBLISHING COMPANY, 28, Stonecutter Street, E.C.

In unserem Verlage erscheint:

DER NATURFORSCHER.

Wochenblatt zur Verbreitung der Fortschritte in den Naturwissenschaften.

Herausgegeben von Dr. WILHELM SKLAREK.

Wöchentlich 1—1½ Bgn. in 4°.

Preis vierteljährlich 4 Mk.

Die nunmehr ihren XIV Jahrgang beginnende Zeitschrift hat bei Allen, welche sich mit Naturwissenschaften beschäftigen, grossen Beifall gefunden.

Probenummern sind durch jede Buchhandlung zu erhalten

Berlin, S.-W., 77, Charlottenstr.

FERD. DÜMMLER'S VERLAGSBUCHHANDLUNG.
(Harrwitz & Gossmann.)

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

NATURAL HISTORY OF BRITISH FISHES: their Structure, Economic Uses, and Capture by Net and Rod. Cultivation of Fish-ponds. Fish suited for Acclimatisation. Artificial Breeding of Salmon. By the late FRANK BUCKLAND, H.M. Inspector of Fisheries. With numerous Woodcuts. Crown 8vo, cloth boards, 5s.

MANUALS OF ELEMENTARY SCIENCE.

Fcap 8vo, limp cloth, 1s. each.

Just Published.

ELECTRICITY. By Prof. FLEEMING JENKIN, F.R.S. With numerous Illustrations.

Already Issued.

ASTRONOMY. By W. H. M. CHRISTIE, M.A., F.R.A.S., Chief Assistant of the Royal Observatory, Greenwich.

BOTANY. By Prof. BENTLEY, of King's College, London.

CHEMISTRY. By ALBERT J. BERNAYS, Ph.D., F.C.S., Professor of Chemistry at St. Thomas's Hospital.

CRYSTALLOGRAPHY. By HENRY PALIN GURNEY, M.A., Fellow of Clare College, Cambridge. With numerous Illustrations.

GEOLOGY. By T. G. BONNEY, M.A., F.G.S., St. John's College, Cambridge.

MATTER AND MOTION. By J. CLERK MAXWELL, M.A., &c.

PHYSIOLOGY. By F. LE GROS CLARK, F.R.S., Surgeon of St. Thomas's Hospital.

THE SPECTROSCOPE AND ITS WORK. By R. A. PROCTOR, Esq. With Coloured Diagram of the Spectra and many Illustrations.

ZOOLOGY. By ALFRED NEWTON, M.A., F.R.S.

NATURAL HISTORY RAMBLES.

In Search of Minerals. By the late D. T. ANSTED, M.A., F.R.S., formerly Fellow of Jesus College, Cambridge, &c. With numerous Woodcuts. Fcap. 8vo, cloth boards, 2s. 6d.

"It is probable that his interesting chapters will induce many to go in search of minerals for themselves."—*Athenæum.*

Ponds and Ditches. By M. C. Cooke, M.A., LL.D., Author of "The Woodlands." With numerous Woodcuts. Fcap. 8vo, cloth boards, 2s. 6d.

Lane and Field. By the Rev. J. G. WOOD, M.A., Author of "Homes without Hands," &c. With numerous Woodcuts. Fcap. 8vo, cloth boards, 2s. 6d.

The Woodlands. By M. C. Cooke, M.A., LL.D. With numerous Woodcuts. Fcap. 8vo, cloth boards, 2s. 6d.

Lakes and Rivers. By C. O. Groom NAPIER, F.G.S., Author of "The Food, Use, and Beauty of British Birds," &c. With numerous Woodcuts. Fcap. 8vo, cloth boards, 2s 6d.

Mountain and Moor. By J. E. TAYLOR, Esq., F.L.S., F.G.S., Editor of "Science Gossip." With numerous Woodcuts. Fcap 8vo, cloth boards, 2s. 6d.

Underground. By J. E. Taylor, Esq., F.L.S., F.G.S., Editor of "Science Gossip." With numerous Woodcuts Fcap. 8vo, cloth boards, 2s. 6d.

The Sea-shore. By Prof. P. Martin DUNCAN, M.B. (Lond.), F.R.S. With numerous Woodcuts Fcap 8vo, cloth boards, 2s. 6d.

"These handy little volumes are well put together, and seem to us decidedly superior to works of a similar kind with which we used to be familiar in our youth."—*Nature.*

At the Depôts in London and Brighton a discount of 2d. in the shilling is allowed to Non-Members off all the miscellaneous publications of the Society.

LONDON: NORTHUMBERLAND AVENUE, CHARING CROSS, W.C.; 43, QUEEN VICTORIA STREET, E.C.;
48, PICCADILLY, W.; and 135, NORTH STREET, BRIGHTON.

With 200 Illustrations, Medium 8vo, 30s.

THE CAT.

AN INTRODUCTION TO THE STUDY OF BACK-BONED ANIMALS, ESPECIALLY MAMMALS.

BY ST. GEORGE MIVART, F.R.S.,

Author of "Lessons from Nature," &c., &c.

The principal feature of this work is that while giving a detailed account of one animal, it serves to explain the principles and leading facts of all the different sciences with which the Student of Natural History has to deal.

JOHN MURRAY, ALBEMARLE STREET.

JUST PUBLISHED, crown 8vo, cloth, 5s

CONSCIOUS MATTER;

OR, THE PHYSICAL AND THE PSYCHICAL UNIVERSALLY IN CAUSAL CONNECTION.

By W. STEWART DUNCAN.

"The writer is evidently a vigorous thinker. There is more gain to philosophy in a bit of independent thinking like this . . than in bulky volumes of orthodox doctrine, where learned industry passes for original criticism."—*Westminster Review.*

London: DAVID BOGUE, 3, St. Martin's Place, W.C.

Ready this day, Demy 4to, Price 14s.

With 30 Outline Plates, 1 Coloured Plate, and 27 Wood Engravings.

DIARY OF SOCIETIES.

LONDON

THURSDAY, April 28.

Royal Society, at 4.30.—The Influence of Stress and Strain on the Action of Physical Forces: H. Tomlinson.—The Metamorphosis of Lucifer; a Study in Morphology: W. K. Brooks.

Society of Telegraph Engineers, at 8.—Discussion on Mr. St. George Lane Fox's Paper On the Application of Electricity to Lighting and Heating for Domestic and other purposes.

Royal Institution, at 3.—Magnetism: Prof. Tyndall.

Society of Arts, at 8.—Impurities in Water: G. S. Johnson.

FRIDAY, April 29.

Royal Institution, at 9.—Language and Literature of the Scottish Highlands: Prof. Blackie.

Society of Arts, at 8.—The Building Arts of India: General Maclagan.

SATURDAY, April 30.

Royal Institution, at 3.—Scotland's Part in English Literature: Prof. Morley.

Epping Forest Naturalists' Field Club, at 7.—Exhibition and Description of Three Neolithic Implements from the Neighbourhood of Chelmsford: H. Corder.—The First Nights "*sugaring*" in England; a Reminiscence of Epping Forest in 1843: James English.

MONDAY, May 2.

Society of Arts, at 8.—Lacemaking: Alan S. Cole.

Victoria Institute, at 8.—The Philosophy of Mr. Herbert Spencer: Rev. W. D. Ground.

Aristotelian Society, at 7.30.—Hegel (continued): Prof. W. T. Harris and Dr. J. Burns-Gibson.

Royal Institution, at 2.—Annual Meeting.

TUESDAY, May 3.

Zoological Society, at 8.30.—On some Points in the Anatomy of the Cæcum in the Hare and Rabbit: W. N. Parker.—Contributions to the systematic arrangement of the *Asteroidea*. Part I. On the Species of the Genus *Asterias*: Prof. F. Jeffrey Bell, F.Z.S.—Additional Observations on the Anatomy of the Spotted Hyæna: Dr. M. Watson, F.Z.S.—On the Indian Species of the Genus *Mus*: Oldfield Thomas, F.Z.S.

Royal Institution, at 3.—Non-Metallic Elements: Prof. Dewar.

WEDNESDAY, May 4.

Society of Arts, at 8.—Buying and Selling: Prof. Bonamy Price.

Entomological Society, at 7.

THURSDAY, May 5.

Royal Society, at 4.30.

Linnean Society, at 8.—On the Dragon's-Blood Tree and its Products: Prof. Bayley Balfour.—On New Species of *Cellepora* from the *Challenger* Expedition: Prof. G. Busk.—New Genera of Plants from Madagascar: Prof. Bayley Balfour.

Chemical Society, at 8.—On the Action of Humic Acid on Atmospheric Nitrogen: E. W. Prevost.—On the Active and Inactive Amylamines: R. T. Plimpton.—On the Products of the Action of Alkalies on Ethyl, β-Ethyl-aceto Succinate: L. D. Thorne.—On the Action of Sodium Alcoholates on Fumaric Ether: T. Purdie.

Royal Institution, at 3.—Magnetism: Prof. Tyndall.

FRIDAY, May 6.

Royal Institution, at 9.—The Land Systems of England and Ireland: Hon. George Brodrick.

Geologists' Association, at 8.

SATURDAY, May 7.

Royal Institution, at 3.—Scotland's Part in English History: Prof. H. Morley.

BRITISH MUSEUM.

The BRITISH MUSEUM will be closed on MONDAY, the 2nd, and reopened on MONDAY, the 9th of May.

EDW. A. BOND, Principal Librarian.

SECOND EDITION.

GRIFFIN'S

CHEMICAL HANDICRAFT.

PRICE 4s. 7d. POST FREE.

A CATALOGUE OF CHEMICAL APPARATUS:

ILLUSTRATED, CLASSIFIED, DESCRIPTIVE.

Demy 8vo, 480 pp., Illustrated with 1,600 Woodcuts.

Most Complete and Cheapest List of Apparatus.

JOHN J. GRIFFIN AND SONS, 22, GARRICK STREET,
LONDON, W.C.

C. KEGAN PAUL & CO.'S LIST.

Crown 8vo, cloth, 5s.

SIGHT: An Exposition of the Principles of Monocular and Binocular Vision. By JOSEPH LE CONTE, LL.D., Professor of Geology and Natural History in the University of California. With 132 Illustrations.

*** Vol. XXXIII. of "The International Scientific Series."

Second Edition.

GENERAL PHYSIOLOGY of MUSCLES and NERVES. By Prof. J. ROSENTHAL. Crown 8vo, with Illustrations, cloth, 5s.

*** Vol. XXXII. of "The International Scientific Series."

"A well-written and careful summary of existing knowledge by a perfectly competent authority, set forth in as simple language as is consistent with the very abstruse nature of the problems discussed."—*St. James's Gazette.*

Second Edition.

The NATURAL CONDITIONS of EXISTENCE as they AFFECT ANIMAL LIFE. By KARL SEMPER. With 103 Illustrations, crown 8vo, cloth, 5s.

*** Vol. XXXI. of "The International Scientific Series."

"Unquestionably one of the most interesting contributions to zoological literature that has appeared for years . . . The book is very freely illustrated with well-executed woodcuts."—*Popular Science Review.*

Second Edition.

THE ATOMIC THEORY. By Prof. WURTZ. Translated by E. CLEMINSHAW, F.C.S. Crown 8vo, cloth, 5s.

"At once a scientific treatise and an artistic work. The translator has very fairly maintained the clearness and crispness of the French style, whereby the book is marked with a distinct individuality and self-completeness."—*Nature.*

Demy 8vo, cloth, price 7s. 6d.

MATHEMATICAL PSYCHICS: An Essay on the Application of Mathematics to the Moral Sciences. By F. Y. EDGEWORTH, M.A.

2 vols., large post 8vo, cloth, 32s.

The EVOLUTION of MAN: A Popular Exposition of the Principal Points of Human Ontogeny and Phylogeny. By Prof. ERNST HAECKEL. With Coloured Plates and numerous Engravings on Wood.

"Prof. Haeckel's work is written in an admirably clear style, and the statement of scientific details, illustrated by excellent engravings and diagrams, is such that any attentive reader, however little conversant with such things, can have no difficulty in understanding it."—*Spectator.*

2 vols., large post 8vo, cloth, 32s.

The HISTORY of CREATION. By Prof. ERNST HAECKEL. Translation revised by E. RAY LANKESTER. With Coloured Plates and Genealogical Trees of the various Groups of both Plants and Animals.

"The author has discharged a most difficult task with conscientious skill and marvellous ability."—*Science Gossip.*

Crown 8vo, cloth, 5s.

FREEDOM in SCIENCE and TEACHING. From the German of Prof. Ernst Haeckel. With a Prefatory Note by T. H. HUXLEY, F.R.S.

Crown 8vo, cloth, 4s. 6d.

CLAIRAUT'S ELEMENTS of GEOMETRY. Translated by Dr. KAINES. With 145 Figures.

Crown 8vo, cloth, price 5s.

A CLASS-BOOK of CHEMISTRY, on the Basis of the New System. By EDWARD L. YOUMANS. With 200 Illustrations.

"He has furnished a series of questions which will, we doubt not, be found extremely useful by the young student."—*Popular Science Review.*

"We have the greatest possible pleasure in recommending his class-book, which is certain in its present form to obtain a new lease of popularity."—*Glasgow News.*

New and Cheaper Edition.

FIRST BOOK of BOTANY. Designed to Cultivate the Observing Powers of Children. By ELIZA A. YOUMANS. With 300 Engravings, crown 8vo, cloth, price 2s. 6d.

"It is but rarely that a school-book appears which is at once so novel in plan, so successful in execution, and so suited to the general want as to command universal and unqualified approbation, but such has been the case with Miss Youman's 'First Book of Botany.' It has been everywhere welcomed as a timely and invaluable contribution to the improvement of primary education."—*Pall Mall Gazette.*

New and Cheaper Edition.

FIRST BOOK of ZOOLOGY. With numerous Illustrations. By EDWARD S. MORSE, Ph.D. Crown 8vo, cloth, price 2s. 6d.

"A comprehensive and useful little treatise for pupils who desire to obtain a general knowledge of the structure, habits, modes of growth, and other leading features of the various forms of animal life."—*Standard.*

"If properly prepared, there is no nicer or more wholesome preparation of cocoa."—*Food, Water, and Air, edited by Dr. Hassall.*
J. S. FRY & SONS, Bristol and London.

Now publishing in Crown 8vo, price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

EDITED BY JOHN MORLEY.

JOHNSON. By Leslie Stephen.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. Hutton.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. Morison.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. Symonds.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Professor Huxley, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By William Black.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. Minto.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal Shairp.

"None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the Dean of St. Paul's.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By Anthony Trollope.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By John Morley.

"Perhaps the best criticism yet published on the life and character of Burke is contained in Mr. Morley's compendious biography. His style is vigorous and polished, and both his political and personal judgment, and his literary criticisms, are just, generous, subtle, and in a high degree interesting."—*Saturday Review.*

MILTON. By Mark Pattison.

"Every page gives us something new to learn, or something old put in such a way as to be almost equivalent to that which is new."—*Academy.*

HAWTHORNE. By Henry James, Jun.

"Probably no one living could have done so good a book on Hawthorne as Mr. James has done."—*Saturday Review.*

SOUTHEY. By Prof. Dowden.

"A truly scholarly and delightful monograph of a great writer, who has been of late years undeservedly neglected."—*Examiner.*

CHAUCER. By A. W. Ward.

"An enjoyable and excellent little book is this of Professor Ward's. Far away the best connected account of Chaucer and his work to be found in English."—*Academy.*

COWPER. By Goldwin Smith.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

BUNYAN. By J. A. Froude.

"The life and character of Bunyan stands out in bold relief, and for the first time the author of the 'Pilgrim's Progress' is portrayed as he really existed."—*Westminster Review.*

BYRON. By Professor Nichol.

"Decidedly one of the most careful and valuable of the whole series. When a book is so good as Prof. Nichol's, there is little to be said about it, except to recommend it as widely as may be."—*Athenæum.*

LOCKE. By Professor Fowler.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Professor Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

POPE. By Leslie Stephen.

"The sketch of Pope's life which Mr. Leslie Stephen has written is interesting throughout. . . . A work which one can only lay down with the wish to have a good deal more on the same subject by the same hand."—*Academy.*

WORDSWORTH. By F. W. H. Myers.

"Mr. Myers gives us a picture of the man and an estimate of his work, which is certainly not inferior to anything that has preceded it. . . . Possibly the best chapter in the book—every chapter of which is excellent—is that on Natural Religion."—*Academy.*

DRYDEN. By George Saintsbury.

"Mr. Saintsbury's very careful, fine, and interesting volume . . . seems to us to hold a place of its own amongst the series."—*Daily News.*

***** Other Volumes to follow.**

MACMILLAN AND CO., BEDFORD STREET, COVENT GARDEN, W.C.

Messrs. MACMILLAN & CO.'S PUBLICATIONS.

Eversley Edition.

CHARLES KINGSLEY'S NOVELS.

MESSRS. MACMILLAN & CO. have the pleasure to announce a **NEW EDITION** of the **NOVELS OF CHARLES KINGSLEY**, which they will publish immediately under the above title.

This Edition has been planned to meet the wish expressed by many admirers of Mr. KINGSLEY for a really beautiful Edition of his Novels. **THE EVERSLEY EDITION** will therefore be printed from new type by Messrs. R. & R. CLARK, on a paper specially manufactured for this work by Messrs. JOHN DICKINSON & CO.; the binding will be done by Messrs. JAMES BURN & CO., and the Publishers hope that the mechanical production will be found in every respect worthy of the books themselves.

THE EVERSLEY EDITION will be comprised in Eleven volumes, Globe 8vo, and will be published at a uniform price of **FIVE SHILLINGS** per volume.

A Portrait by Mr. LOWES DICKINSON of **CHARLES KINGSLEY** in his Study at Eversley, never before engraved, will appear as a Frontispiece in the First Volume.

The Books will be published in the following order:—

WESTWARD HO!	2 vols.	10s.	*May.*
TWO YEARS AGO	2 vols.	10s.	*June.*
HYPATIA	2 vols.	10s.	*July.*
YEAST	1 vol.	5s.	*August.*
ALTON LOCKE	2 vols.	10s.	*September.*
HEREWARD THE WAKE	2 vols.	10s.	*October.*

*** *Subscribers' Names will be received by all Booksellers.*

ANTHROPOLOGY: an Introduction to the Study of MAN AND CIVILISATION.

By E. B. TYLOR, D.C.L., F.R.S. With numerous Illustrations. Crown 8vo. 7s. 6d.

"It is an endeavour to put before the lay readers in a clear, condensed, and interesting form the main settled results of modern investigations into the science of man. . . . Mr. Tylor's admirable little book certainly deserves the success with which it will doubtless meet."—*Pall Mall Gazette.*

"It is a most attractive and entertaining introduction to the science of anthropology. . . . His writing is clear and luminous, and his arrangement masterly."—*Saturday Review.*

MANUAL OF ANCIENT GEOGRAPHY. From the German of Dr. H. KIEPERT.

Crown 8vo. 5s.

"Dr. Kiepert actually succeeds in making ancient geography interesting, connecting it as he is able to do from his extensive and scholarly knowledge with the natural features of the various countries, the movements of various races, and modern conditions. The arrangement is methodical and the treatment clear and well defined, the connection between the Old World and the New being always kept in sight. . . . Altogether the English edition of the Manual will form an indispensable companion to Kiepert's 'Atlas,' now used in many of our leading schools."—*The Times.*

GRAPHICAL DETERMINATION OF FORCES IN ENGINEERING STRUCTURES.

By J. B. CHALMERS, C.E. With Illustrations. 8vo. 24s.

THE STEAM ENGINE AND ITS INVENTORS: a Historical Sketch.

By ROBERT L. GALLOWAY, Mining Engineer. With numerous Illustrations. Crown 8vo. 10s. 6d.

"Mr. Galloway's capital little book."—*English Mechanic.*

"A book of singular local and general interest."—*Newcastle Weekly Chronicle.*

"We regard it as a valuable addition to engineering literature."—*Colliery Guardian.*
